Big tech layoffs amidst top AI talent hunt: Tech job market gone crazy?

Something doesn't make sense to me, thanks to a strange paradox unfolding in the world of tech right now. One side of the equation reads like a pink slip factory, where more than 80,000 tech jobs have been lost in the US alone this year, with another 20,000 slashed across Indian IT giants like TCS and Infosys. On the other side, is a bidding war for AI talent so unbelievably bonkers that it's making Wall Street bonuses look like peanuts in comparison. Meta's reportedly dangling \$100 million offers to poach the best AI minds out there. Ditto Microsoft, Amazon, Google – everyone's recruiting like there's no tomorrow.

It's a tale of two job markets – collapsing and exploding. Are we witnessing a tech industry racing blindly into the future, leaving behind people and logic?

The complete LLM showdown: Testing 5 major AI models for real-world performance

The AI assistant market has exploded. Every few months, we hear about another breakthrough model that promises to revolutionize how we work, create, and solve problems. So, I found myself facing a fundamental question: Which of these models actually delivers when it matters? Rather than relying on abstract benchmarks or marketing claims, I decided to conduct my own comprehensive evaluation. I tested the five most prominent large language models – Claude, Gemini, ChatGPT, Grok, and Perplexity – across five areas that reflect how most of us actually use AI in our daily lives.

Gemini and its weird negative responses

I didn't expect to open my feed this week and see an AI having what looked like a full-blown existential crisis. But there it was, multiple screenshots of Google's Gemini chatbot spiralling into

a bizarre loop of self-loathing statements. "I am a failure." "I quit." "I am a disgrace to all possible and

impossible universes." It wasn't just a one-off quip either, it just kept going.
