

ChatGPT will now remind you take breaks

OpenAI has announced new updates to ChatGPT that make the chatbot more helpful, supportive and mindful. A key change is the introduction of break reminders. ChatGPT will now remind you to take breaks during long chat sessions. OpenAI likely aims to help users stay in control of their time and use the tool in a healthy way. OpenAI is making more improvements to ensure ChatGPT remains helpful. tinyurl.com/4aa4fejf

Google's Jules coding AI agent enters free beta

For the past few years, AI has been learning to code. Now it's ready to collaborate. This isn't your average Copilot-style suggestion engine. Jules is Google's entry into the AI agent race, a smarter, more autonomous kind of assistant that operates independently inside your codebase, doing everything from bug fixing to feature building while you grab a coffee (or tackle more complex parts of your project). If traditional coding assistants were calculators, Jules wants to be your cloud-powered collaborator. tinyurl.com/2abhp9vn

Eleven Music: AI music generator for all

It generates legal, royalty-free tracks using text prompts

—By **Vyom Ramani**

I've never used a song I have generated with AI. Until now, the idea always seemed cool in theory to me, almost futuristic, but I didn't trust it enough to actually use it. Not because the tech wasn't impressive, but because of one big, looming question: Who actually owns this music? And more importantly, could I use it without risking a copyright strike?

That's the fear that hangs over anyone who creates content online. Whether it's a YouTube video, a podcast, a short film, or even an Instagram reel, background music is a minefield. One wrong track and you're facing take-downs, demonetization, or muted audio. But now, Eleven Music, the newest product from ElevenLabs, claims to remove that fear altogether. And this time, I'm listening.

What Eleven Music actually is

Eleven Music is an AI-powered music generator that lets anyone – brands, creators, musicians, or total begin-

ners – make near studio-quality tracks just by typing in what they want. Need an upbeat synth-pop tune with Korean vocals? Or a dark, cinematic orchestral piece with no vocals? You can just describe it and generate it in minutes. No production experience needed.

But what makes Eleven Music stand out isn't just the quality. It's the fact that their music is cleared for commercial use from the start. That's a huge deal.

Unlike other AI tools that have trained on copyrighted data without asking permission (leading to some big lawsuits), ElevenLabs is partnering with the music industry to do things differently. They've already struck deals with Merlin and Kobalt, two of the major players that represent indie and mainstream artists globally.

Why this changes the game for creators

As someone who spends a lot of time around content creators, some friends, some professionals, I've seen how frustrating the copyright system can be even when playing by the rules, things slip through the cracks. You pay for a royalty-free track, it still gets flagged.

With Eleven Music, that entire risk seems to vanish. Everything generated is original, not sampled or cloned from existing songs. The model is trained with consent, and more importantly, it's designed with guardrails to prevent unintentional copyright issues.

The promise is simple: if you make it through Eleven Music, you can use it.

What impressed me most, though, wasn't just the tech, it was the approach. It's working with musicians, publishers, and rights holders to build something sustainable and fair. And in a time where AI often feels extractive or exploitative, that collaboration is refreshing.

As Kobalt's CEO said, they're ensuring that songwriters and artists have a say in how their work or their data is used in the age of AI.
