

sheet is ambitious: a 50MP OmniVision OV50H main sensor, 50MP Samsung JN5 telephoto, 50MP JN1 ultrawide, and 50MP front camera, the real surprise is just how well they all come together.

In daylight, the main camera is reliable and a joy to shoot with. The colours are punchy and saturated, but not overcooked. Reds, yellows, and blues pop with vibrancy, yet still feel grounded. You'll see it in the crimson of Ixora flowers or the rich turquoise of a Royal Enfield tank, it's bright, confident, and clean. The detail capture is sharp, not overly sharpened: the texture of a motorcycle helmet, the fine weave of a shirt, even the stamens of a pomegranate

flower, all rendered crisply without turning into a crunchy HDR mess.

The low light performance is also shockingly competent. The shots taken in parks or alleys retain remarkably clean shadows, with minimal grain and excellent control over blown-out highlights. The detail in grass under artificial lighting, or the texture of buildings under streetlights, stays intact.

The ultrawide camera, powered by Samsung's ISOCELL JN1, holds its own too. Yes, it softens a bit at night and can occasionally flare with strong light sources, but its 114° field of view feels immersive, distortion is minimal, and tonal balance matches the main sensor well, which is more than most ultrawides in this range can claim.

Then there's the telephoto lens, using a 50MP ISOCELL JN5 sensor. This is not your usual 2MP filler. 3x optical and 6x lossless zoom looks detailed, and the 60x AI zoom, while a bit of a gimmick, still produces surprisingly readable images under the right lighting. Where it shines most is in macro mode, allowing for tight, sharp close-ups without switching to a gimmicky "macro" sensor, something the close-up shots of plumeria and pomegranate flowers prove beautifully.

If there's one thing to watch for, it's the occasional focus hunting in low light or when switching lenses during video. It's not constant, but it happens, particularly with the ultrawide and

telephoto. HDR video occasionally over-corrects and introduces slight motion judder when panning. And while you can switch lenses in video, it's not as fluid as you'd like during a rolling shot.

This is easily the most versatile and competent camera system Nothing has ever shipped, but at the price, you get options like the Vivo X200 Pro which offers real flagship-grade photography chops and a camera setup that looks like a distant dream for Nothing.

VERDICT

The Nothing Phone 3 is trying to build identity and dares to be visually bold, functionally playful and intentional.

Yes, it's priced close to real flagships, starting at Rs 79,999, to be exact. And at that price, you're staring directly at options like the Samsung Galaxy S25, S25 Plus, iPhone 16, OnePlus 13, Pixel 9 Pro, and the Vivo X200 Pro. Phones that come with established flagship pedigrees, better displays, more versatile camera hardware, and in some cases, faster charging or longer update cycles. So calling this a flagship is brave, but it's not quite one.

The LTPO display lacks the finesse of LTPO. The Snapdragon 8s Gen 4 is fast, but not cool under pressure. And the Glyph Matrix, while fun, won't change your life. It nails the fundamentals with a design language that's still miles apart from anything on the market, divisive, but never forgettable.

—Siddharth Chauhan

SPECIFICATIONS

Screen: 6.67-inch AMOLED panel | SoC: Snapdragon 8s Gen 4 | RAM: 12GB LPDDR5X | Storage: 256GB UFS 4.0 | Camera: 50MP OV50H (main) + 50MP (Telephoto) + 50MP (Ultrawide) + 50MP (Front) | OS: Nothing OS 3.5 based on Android 15 | Battery: 5150 mAh, 65W fast charge | Weight: 218g
