

Realme 15 Pro

An all-rounder with a confusing personality

The Realme 15 Pro offers a premium design, bright 144Hz AMOLED display, huge 7000mAh battery, and reliable cameras, making it a solid everyday performer. However, its Snapdragon 7 Gen 4 chipset falls short for heavy gaming at this price. Great for media, photography, and battery life — less so for gamers seeking flagship-level performance.

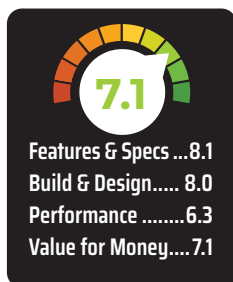

So, it's been 20 days since I started using the Realme 15 Pro. This smartphone packs the Snapdragon 7 Gen 4, a 7000mAh battery, a dual 50-megapixel camera setup, and a 144Hz AMOLED panel. Sounds heavy, right? Now, here's the interesting part: Realme is calling it an 'AI Party Phone'. Why? It's loaded with AI features that help you capture low-light party scenes with good lighting, natural colours, and a few AI effects.

But if I don't party, does that mean this phone is not for me? How does the Realme 15 Pro hold up for a non-party user? Basically, is it a good all-rounder at Rs 31,999, or is it just about flashy tricks? After 20 days of usage and extensive testing, here's how I want to answer those questions.

DESIGN

As for the design, I have said this before, and I'll say it again – curved displays just hit differently. They still feel more premium than flat displays, and the Realme 15 Pro has one. And because of its curved edges, you get a good grip on the phone. That reminds me of its sweet in-hand feel, and credit should go to its sleek and lightweight body.

The Realme 15 Pro measures 7.8mm in thickness and is only 187 grams

heavy. So basically, along with a good-looking design, you get a comfortable body also. Now this colour here, it's called Flowing Silver: Subtle, not too loud, not too plain either. You get a marble-like pattern on this glossy back, and I would say the looks are nice, but some proper back protection would've taken it up a notch.

On the back, you get MIL-STD-810H compliance, also known as military standard protection, but this doesn't guarantee full ruggedness or suitability for extreme conditions. You'll still need to be careful when using it outdoors, as the glass back panel isn't very resistant to breakage.

But yes, you do get full protection against water and dust on this phone. It comes with IP68 and IP69 certification, which means it's not just resistant to dust and water, but also capable of with-

standing high-pressure water jets and even submersion for extended periods. In simple terms, whether you accidentally drop it in the pool, get caught in heavy rain, or use it in dusty outdoor environments, the phone can take it.

There is something new also – the Pulse Light. It is essentially an RGB light that glows for notifications, when GT mode is active, or when you launch the camera. Personally, I'm not a fan of such flashy elements, but I know many users enjoy these little extras. Another design choice that I couldn't ignore is the third camera ring, which surprisingly, is not a camera at all. It's purely for aesthetics. I'm still not sure why this trend is catching on, but for me, it feels more like a gimmick than a functional feature.

DISPLAY

The Realme 15 Pro is equipped with a 6.8-inch 1.5K AMOLED panel, which comes with 144Hz refresh rate support. It looks bright, crisp, and content just pops. You will enjoy binge-watching or just scrolling through Instagram on this screen. I have tested a lot of recent Realme phones, and all of them had one thing in common – fantastic displays. And I'm not just saying that for the sake of it, our testing backs it up.

According to our Calman colour checker test, the Realme 15 Pro has scored a Delta E of 1.6. So basically, this is a test for colour accuracy, and the lower the Delta E number is, the better the colour accuracy is. Anything below a Delta E of 2 is decent. With this score, the Realme 15 Pro delivers colours that are impressively true to life, making it well-suited for everything from watching HDR content to editing photos without worrying about overly exaggerated tones.

Not just good colours, but impressive brightness as well. In our testing, we recorded a peak brightness of 3130 nits in auto mode, which is more than enough. During my usage and testing, the display never felt dim or dull, whether I was outdoors or indoors.
