

Oppo K13 Turbo

Power doesn't quit, cooling fan or not

Okay, so a 'built-in cooling fan' is the USP of this device. The Oppo K13 Turbo Pro takes a different approach to deliver performance to power users. Previously, in my reviews, I have talked about how delivering high power is not as important as maintaining the given power with consistency. These days, we see many smartphones, packed with some crazy powerful processors, but still throttle so much that they can't utilise that power to its full potential.

Now, the Oppo K13 Turbo Pro is powered by the Snapdragon 8s Gen 4 processor, which is capable of delivering flagship-level power. And this phone seems to be trying to solve that age-old problem, power vs consistency. But, this is all on paper information. Is this cooling fan actually helpful?

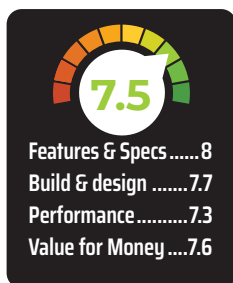

Do we really need it on a phone? What about the battery consumption then? And most importantly, how good is the Oppo K13 Turbo Pro as a phone? I am going to answer all of these questions in this review, so let's bring it on!

DESIGN

Let's start with the most flashy thing we get with the Oppo K13 Turbo – its design. So, I have the Purple Phantom variant, and this one looks loud. It also has a touch of neon green colour, which gives it that gaming phone look. On the right side of the frame, you get a power button, volume rockers, and the ventilation output. The back panel gives you a mechanical, techy feel with all those lines, ridges, and engravings.

If you ask me, I lean more towards subtle colours like its Silver Knight variant, which is not that eye-catching yet looks techy. But, liking this colour can be very subjective; some of my friends loved the purple variant too.

₹39,999

Now, if I talk about the in-hand feel, yes, this phone does feel a bit bulky because of its 8.31mm thickness, but then it has a whole cooling fan inside it, along with a massive 7000mAh battery. So that shouldn't bother me if I'm focused only on performance.

About durability, the Oppo K13 Turbo Pro's display is protected by Jundun Glass. Those who don't know about it, it is a Chinese manufacturer, and is found in budget smartphones. While not as strong as Gorilla Glass Victus, it offers decent scratch resistance for everyday use. This phone is certified IPX9, IPX8, and IPX6 rated. As there's no official dust protection rating, you will have to be careful around dust. It's that 'South Delhi' friend!

DISPLAY

The Oppo K13 Turbo Pro is equipped with a 6.8-inch LTPS AMOLED display. This panel supports a 120Hz refresh rate and can automatically switch

between 60Hz/90Hz/120Hz. It comes with a 1.5K resolution, so you can watch high-quality videos with good sharpness on this phone. The colours that this display produces are also quite close to what your eyes see, and the brightness is also decent.

According to our brightness test, the Oppo K13 Turbo Pro recorded 1770 nits of peak brightness on auto mode. Now, this number should have been higher according to this price point, because the display gets too reflective outdoors, even on full brightness.

Moving on, we also ran the Calman colorchecker test, where we recorded an average delta E of 0.9, which is excellent. This means the display reproduces colours very accurately, staying close to real-life tones without noticeable deviations. So, if you watch too many movies or shows, edit, or game a lot, this one serves.

Now, the whole feel of the display is nice, but there's one thing that ruins my experience – bloatware. The Oppo K13 Turbo Pro has a large number of pre-installed apps that do not look good at all. Yes, they are removable, you can uninstall them, but the first impression impact should be better.

PERFORMANCE

Now, let's come to the real part: how much power under all that flash? Like I mentioned earlier, the Oppo K13 Turbo Pro is powered by the Snapdragon 8s Gen 4 chipset, pretty capable of delivering solid performance. And it delivered as expected on the benchmark tests. It got an AnTuTu score of over 2 million, pretty close to its competitor, iQOO Neo 10R. On the Geekbench 6 test, it scored 2152 on the single-core test and 6744 on the multi-core test. And these are some solid numbers.

And like I said, I wanted to check if this raw power translates into consistency. For that, I ran the CPU Throttling test on it, and the phone delivered. It didn't throttle too much and stayed cool throughout. Even after constant stress, it throttled down to just 82% of its peak performance. Impressive.
