

CYBX cybersecurity app

Offers upto ₹10 lakh insurance against financial scam

Vyom Ramani | editor@digit.in

One evening in Delhi, a young college student received what seemed like a dream deal, a lightly used smartphone at half the retail price. The phone worked perfectly, and she thought she had saved herself months of savings. But within a week, strange SMS notifications started appearing. By the time she checked her bank account, tens of thousands had vanished. Hidden deep inside the phone's system was spyware that logged her keystrokes and sent her banking details to a remote server.

Phishing links disguised as urgent bank messages. Fake QR codes on shop counters. Malicious apps that pose as simple games or tools. The tactics are varied, but the outcome is often the same: emptied accounts, stolen identities, and long battles to recover losses.

The “digital kavach”

Enter 63 SATS, a homegrown cybersecurity company, which has launched CYBX, a smartphone security app designed not just to prevent attacks, but to also soften the blow if an attack does get through to you. At its core, CYBX's function is to act as a mobile threat detection platform, continuously scanning for malware, checking app behaviour in real-time, blocking phishing attempts, and even verifying QR codes before you scan them. But what makes it really stand out is the addition of built-in cyber insurance that offers a coverage of upto ₹10 lakh in case of any losses incurred from scams, identity theft, and other such cybercrimes.

“We don't want to be just the tank sitting on your phone. Our job is like a sniper, we sit there, lay low, when the threat comes, we shoot,” says Neehar Pathare, CEO of 63 SATS.

What it does differently

Unlike most security apps, CYBX takes a layered approach. It offers real-time malware scanning to stop malicious apps and code, QR code verification to block tampered payment codes, and anti-phishing filters for SMS, email, and chat links. It also enables encrypted app-to-app calls, blocking all forms of recording and alerting users if the call is put on speaker, while verified call screening shows if the caller is also protected by CYBX which hints at a potential growing ecosystem.

came from a simple truth: no security is foolproof. “Attackers are constantly innovating... a single tap on the wrong link can cause damage,” he notes.

CYBX's insurance spans losses from UPI frauds, phishing-based account takeovers, malicious app transactions, and even reputational damage from cyberbullying or online harassment. Claims can be initiated directly through the app, with CYBX's backend team gathering digital forensics to validate cases and speed up settlement. Once approved, the insurer reimburses losses

The limitation, though, is that these protections work only within the CYBX app. It remains unclear how they extend to third-party platforms like WhatsApp, Instagram, or even the phone's default camera for QR scanning.

Why insurance matters

Perhaps the boldest part of CYBX's offering is its integrated insurance. Every subscription includes coverage against digital harms from financial fraud to identity theft and even cyberbullying. Pathare says the idea

or covers recovery costs up to the policy limit. The point is to give users a psychological safety net. “You can't just tell someone ‘be careful’ and let them be. We wanted to stand with users even if the worst happens,” he explains.

Backed by ICICI Lombard, the cover comes in three tiers: ₹10,000 for online thefts and shopping fraud, ₹1,00,000 which adds protection against identity theft, cyberbullying, and data breaches, and ₹10,00,000 at the top, giving users the highest possible financial cushion against cyber risks. >
