

Best USB-C GaN charger in India?

Cuzor Pulse 70W makes a strong case

Jayesh Shinde | editor@digit.in

Every now and then, a product comes along that isn't just good on paper, but it feels thoughtfully constructed with precise intent. Like someone actually spent time thinking about how it would live in your bag, on your desk, in the frantic pace of your everyday digital life. The Cuzor Pulse 70W GaN charger is one of those rare objects.

Where the product makers can't stop talking about how thoughtful and innovative it's built from the ground up – cutting open a unit to showcase how it's built inside in forensic detail. Where a single grain in your hand is indicative

of the overall quality of the rice crop, in a matter of speaking. I got that impression of the wizards at Cuzor Labs when I got a chance to interact with them while putting the Cuzor Pulse 70W GaN charger through its paces.

Small enough to vanish in a laptop sleeve, but designed with the conviction of a full-fledged power supply unit, this Made-in-India charger doesn't just aim to compete with global names – it wants to outclass them. In many ways, it does.

"So what we did was instead of going for the regular 65W, we've upped it up to 70W," explains Ashwani Rajan, Co-founder and Head of Product and

Engineering at Cuzor Labs. This is because modern laptops – especially the MacBook Air and MacBook Pro – demand a peak draw closer to 70W, even if they often settle below that. According to Ashwani, "Even if you give it a 140 watt charger, it takes 70 watts – the MacBook 13-inch as well as the 15-inch." I did verify this with an M2 MacBook Air.

Under the hood, the Cuzor Pulse 70W GaN is every bit the spec-sheet warrior its name suggests. It supports a broad input voltage range from 90V to 265V AC, making it travel-ready across geographies, and delivers a maximum output of 70 watts through its dual USB-C ports – marked C1 and C2. When using a single port, either one can push the full 70W. Plug in two devices, and it smartly splits the load – 45W from C1 (ideal for laptops) and 25W from C2 (perfect for phones or smaller devices). It supports major fast-charging protocols including PD 3.0, PPS (3.3–20V), QC 3.0, and QC 2.0, ensuring compatibility with a wide range of devices.

With a power density of 11.97 watts per cubic inch, it outpaces most competitors in this size class, including Apple's own 70W charger (which sits around 9.45 watts) and comparable to Nothing's CMF unit, albeit with more wattage headroom, claims Ashwani Rajan. Efficiency of the Cuzor Pulse 70W GaN charger is rated at 91% when tested at 230V, 50Hz under full load – a mark of well-tuned internal architecture.

It helps that the Cuzor Pulse 70W GaN charger's made with a polycarbonate body – instead of cheaper ABS plastic – making it more durable, more heat-resistant, and reassuringly sturdy. "We've done all these tests in reputed labs," Ashwani told me. "10,000 socket insertions, 10,000 USB insertions, drop tests... This charger is built to last four to five years easily." To top it off, they're offering a two-year doorstep replacement warranty. This sort of confidence in one's product isn't something many companies dare to promise.

The Cuzor Pulse is fortified with all the right protections, according to
