The promise of a robot in the kitchen, one that can effortlessly churn out perfectly puffed rotis, is a tantalizing one. As someone who appreciates both technology and a good meal, I was excited to put Rotimatic Next to the test. Priced at ₹1,65,999 but currently available at ₹1,24,999, this smart roti maker is designed to simplify the grind of meal prep. After weeks of using it, I have to ask: can this smart appliance redefine my kitchen, or is its performance overshadowed by its promises?

Promise vs. reality

Right out of the box, the Rotimatic Next lives up to its reputation for being remarkably easy to set up. The unboxing process was smooth and

It was a necessary step on the path to consistent perfection, and I saw it as a starting point for its AI to begin its learning process. I watched the machine dutifully press out a perfect circle of dough and learned to identify the subtle signs of what was going wrong, which became my cues for adjusting the settings.

Calibrating for perfection

The core of the Rotimatic's process lies in its ability to adapt to your flour and personal preferences. Once it's warmed up, a process that takes about 9 minutes on average, it starts kneading the dough. This is then followed by a cooking time of about 3 minutes per roti. The machine provides three basic settings you can adjust from low to high: "Thickness," "Oil," and "Roast."
