

Vivo V60e

Camera and bigger battery worth it?

The Vivo V60e is a mid-range phone with a good camera, decent specs, a few AI tricks here and there, and done. It's not bringing something brand new to the table, and for good reason, but it does want to roll a little smoother than the V50e. The V60e is an iterative upgrade, yes, but it gets a newer Dimensity 7360 Turbo chip that replaces the 7300, the main camera jumps from 50MP to 200MP, and the battery capacity climbs from 5,600mAh to 6,500mAh. It's also one of the few phones in its segment to offer IP68 and IP69 protection, 4K recording on both cameras and a quad-curved AMOLED display, all wrapped in a 190 gram body.

So the real question isn't what Vivo added this year, but whether any of it truly changes how the V-series feels.

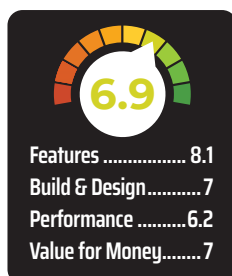

DESIGN AND BUILD QUALITY

The V60e doesn't stray far from the usual V-series formula, it's got the sleek curved edges, two elegant colours: purple and gold and a premium feel that aims to impress right out of the box. That said, the design is a bit more refined than the last model, with the quad-curved screen flowing more naturally into the edges, and it doesn't go overboard with the curves.

Despite housing a significantly larger 6,500mAh battery, the phone remains impressively slim at 7.9mm and light at 190g, just 4 grams more than the V50e. The back panel is made of a plastic composite, not glass, but it's well-finished enough to pass the casual glance test. It doesn't creak, doesn't flex and most importantly, feels solid in hand.

The Diamond Shield Glass adds a layer of drop resistance, and IP68/69 certification gives it most of its dura-

₹29,999

bility cred, which is reassuring for daily use. Both colour options, purple and gold, are bright, have a subtle matte finish and a bit of flair that keeps the V-series manifesto at the forefront.

DISPLAY

The V60e clearly outshines the V50e when it comes to the display quality. The 6.7-inch quad-curved AMOLED screen feels more premium in use, and while Vivo claims a 1600 nits of local peak brightness, in my testing, the panel hit a much higher 2550 nits of peak brightness in the Bright colour profile and 1065 nits in the manual mode. This makes it one of the brightest screens in the sub-Rs 30,000 bracket and is easily visible under sunlight.

The V60e display also nails the colour accuracy. In our Calman Colour-Checker analysis, the V60e posted an average Delta E of 1.4 and a maximum Delta E of 3.1, which means colours are rendered impressively close to their intended tones. The 95.6% sRGB cov-

erage ensures the display looks vibrant yet natural.

In daily use, the display delivers solid contrast, deep blacks and even at high brightness, there's no colour shift or banding across tones. The 120Hz refresh rate keeps scrolling and animations smooth and fast. The HDR10+ support works well across YouTube and OTT apps such as Netflix, Prime Video, and the quad-curved design of the screen adds a sense of depth when viewing content, making it immersive and free of glare and ghost touches.

CAMERAS

The jump from V50e's 50-megapixel camera to the V60e's 200-megapixel main camera gives impressive results, especially because Vivo leans into computational photography with a large 1/1.56-inch Samsung HP5 sensor that offers over 150% light-sensitive area.

In daylight, the V60e's 23mm primary camera delivers vivid, balanced images. Colours have the familiar Vivo punch and are slightly saturated but rarely unnatural. The camera maintains excellent detail and dynamic range, pulling back highlights in bright skies while preserving textures in shaded areas. The software sharpening is visible but controlled, giving photos that clean, ready-to-post look without over-processing. Compared with the V50e, detail and dynamic range are clearly improved, thanks to both the higher-resolution sensor and better tuning.

Zoom performance, however, is where the limits of computation show. The phone relies on in-sensor cropping for 2x shots, which remain highly usable and consistent with the main camera's colour science. Beyond that, quality drops fast. At 3x and 5x, images look softer, with fine textures smearing under noise reduction.

The 8MP ultrawide camera is a pleasant surprise. Colour consistency with the main sensor is well maintained, distortion is minimal, and detail loss at the edges is mild. The 200MP high-resolution mode works as adver-
