

Sony Bravia 5 Mini LED TV

Bright, accurate and built for purists

₹1,33,660

The Bravia 5 delivers a blend of brightness, realism, and colour finesse that's distinctly Sony and I feel it is the most complete Mini LED TV Sony has made in a long time, here's why.

PICTURE QUALITY

The Bravia 5 uses Sony's XR Backlight MasterDrive Mini LED system, which finely controls thousands of LEDs for stunning luminance consistency and contrast control. In our Calman tests, the Bravia 5 reached 913 nits at a 25% window and 710 nits at 10%, with deep blacks measured at just 0.22 nits and a native contrast ratio of 3229:1. This gives the Bravia 5 a huge dynamic range with preserved shadow detail and minimal blooming.

In HDR mode, the panel achieved 95.85% UHDA-P3 coverage, alongside 77.28% BT.2020 coverage which is comfortably within the premium performance range. The XR Triluminos Pro engine produces rich, natural tones, especially in skin textures and

shadows, while XR Clear Image enhances texture in upscaled content.

Colour accuracy is another strong suit and shows just how well-calibrated this TV is. Our HDR ColorChecker test recorded an average DeltaE of 2.8 and a maximum of 5.8, indi-

cating reference-grade precision. The grayscale tracking graph showed a tight RGB balance with minimal deviations and Sony's EOTF curve nearly mirrored the PQ target line which is a testament to how well Sony's Cognitive Processor XR does tone mapping.

In daily use, HDR content looks phenomenal on the Bravia 5. The viewing experience feels cinematic without needing manual tweaking. Details in low-light scenes are exceptional, and you get the kind of clarity where you can distinguish subtle background gradations in *The Revenant*'s bonfire sequence or the desert sequence in *Rings of Power*. In mixed-brightness scenes, the panel demonstrates remarkable balance with bright reflections and

darker regions coexisting beautifully without colour shift or crushed blacks.

Sony's local dimming algorithms deserve particular credit. There's virtually no visible blooming or haloing around subtitles or text, even during high-contrast transitions. The TV also preserves dark skin tone details in bright scenes, something most Mini LEDs struggle with.

Judder control is also impressive. Motion feels fluid, with almost no visible judder, even in challenging pan shots like the opening sequence of *The Martian* or the tracking sequences in *Severance*. You'll only notice it if you really go looking for it.

SDR AND CALIBRATION

Switching to SDR, the Bravia 5 maintains its accuracy-first DNA. In Professional Mode, the TV recorded an average DeltaE of 1.8 (maximum 4.5), which is well below the visible error threshold. Grayscale tracking was impressive too, with an average DeltaE of 1.6, a colour temperature of 6568K (near perfect with D65), and a gamma average of 2.08.

This accuracy translates beautifully to everyday viewing. SDR content looks neutral and natural where whites appear clean, skin tones warm yet accurate, and contrast remains balanced even in challenging ambient light.

Upscaling through XR Clear Image deserves a nod here. Older HD and SDR content scales cleanly to 4K, with minimal noise and preserved texture, whether it's broadcast sports or legacy films and TV shows.

AUDIO AND SOUND PERFORMANCE

Sony continues to excel in sound. The Acoustic Multi-Audio system features sound-positioning tweeters and down-firing full-range drivers, complemented by a subwoofer for fuller bass. Total output sits at 50W (2.1ch), and thanks to AI Sound Separation technology, dialogue clarity remains strong even in busy scenes.

Pair the TV with a compatible Sony soundbar, and you can enable Acoustic
