

Lumio Arc 5 & Arc 7 Projector

Cinematic magic for home

Lumio's entry into the projector market is a deliberate response to what's wrong with budget projectors today. The Lumio Arc 5 and Arc 7 are designed and tuned in India, promising a frictionless experience powered by Google TV, and both aim to make the big-screen dream accessible without the usual compromises.

These two projectors share the same design and software philosophy, but they serve different audiences. The Arc 5 targets first-time buyers looking for a dependable entry-level experience under Rs 20,000, while the Arc 7 steps up the performance in terms of cinematic, accurate, and immersive picture.

DESIGN & BUILD

Both the Arc 5 and Arc 7 follow Lumio's vertical tower design, which saves table

EASE OF USE

One of Lumio's biggest achievements with the Arc series is how effortless the setup feels. Both projectors feature auto keystone correction, auto focus, and

obstacle avoidance, driven by a Time-of-Flight (ToF) sensor. In practice, it works far more accurately than what we've seen from budget projectors, correcting trapezoidal distortion and instantly refocusing when moved.

You can place the Arc on a coffee table, bedside stand, or tripod mount, and it recalibrates almost instantly. The built-in foldable kickstand (or as Lumio calls it, the "Under Stand") makes quick angle adjustments effortless. It's truly plug-and-play: one power cable, one button, and within seconds you're greeted by a clean Google TV interface with native Netflix support.

PICTURE QUALITY

This is where the Arc 5 and Arc 7 begin to part ways. In side-by-side testing, the Arc 7 immediately stands out for its neutral and accurate colour temperature. Whites look clean and balanced with just a hint of coolness, and skin tones appear natural. The Arc 5, on the other hand, exhibits a noticeable warm/magenta tint, especially visible in menus, grayscale charts, and white backgrounds. While this cast doesn't ruin the experience for casual viewing, it does push the overall tone towards pinkish hues, which becomes obvious during bright scenes or sports.

Brightness and Contrast

The difference between 200 ANSI lumens (Arc 5) and 400 ANSI lumens (Arc 7) is more significant than the numbers suggest. The Arc 7 produces a visibly brighter and more dynamic image with stronger perceived contrast, especially in dark-room environments. Highlights pop more distinctly, adding depth and dimension to movies and games. The Arc 5, while dimmer, still offers a comfortably viewable image in dark rooms and small spaces, perfectly adequate for binge sessions, provided you manage ambient light and your expectations.

Colour Reproduction

The Arc 7's wider and more balanced colour output helps deliver vibrant yet
