

SHOKZ OpenRun Pro 2

The headset for hyper-awareness

When it comes to headphones, most people look for two things: great sound and great noise cancellation. The Shokz OpenRun Pro 2 goes for a completely different idea altogether. This isn't a headset that tries to shut out the world – it's designed to let the world in.

After weeks of using it across work, workouts, commutes, and even downtime, I've come to see it less as "just another pair of headphones" and more as a specialized tool. Its singular mission seems to be keep me connected to my environment without making me compromise too much on sound quality. For someone like me, who likes to go for an occasional run outdoors after a long work day in the office, this promise of hyper-awareness was too compelling.

So, after putting the Shokz OpenRun Pro 2 through its paces for the past two weeks, here is my unfiltered take on these bone conduction headphones.

Bone conduction 2.0

The core of the OpenRun Pro 2 is Shokz's new DualPitch Technology, and it's easily the biggest leap from

earlier generations. Bone conduction headphones have always fascinated me in theory – you place them on your cheekbones, and they vibrate to send sound through your bones instead of your ear canal. In practice, though, they've always had issues. The biggest one for me: that annoying "tickle" when you turn up the volume, especially with bass-heavy music.

Shokz tackles this by pairing the traditional bone conduction driver with a tiny speaker that specifically boosts low-end frequencies. The effect is surprisingly transformative. Instead of pushing all the sound through my cheekbones, the headset lets the air speaker handle bass reinforcement, while bone conduction focuses on mids and highs.

The result? The vibration that I was dreading when I picked these up was practically not there. I now listen comfortably at 60–80% volume, and even when I crank it all the way up, the vibration is minimal. It feels more like listening to unconventional earbuds than some strange science experiment strapped to my face – at least when not using its "Classic Mode".

Design

One of the things I appreciate about good headsets is that they are built with activity in mind, not style points. The OpenRun Pro 2 is no exception.

All the controls are tactile and easy to use on the move. On the underside of the band near my right ear are the power/volume buttons and the USB-C port. I like that Shokz finally embraced USB-C – no more hunting down a proprietary cable when the battery dies.

On the left driver module is the Multifunction Button. One press pauses or plays music (or answers a call), two presses skip tracks, three go back. The placement is intuitive enough that I found myself controlling playback by touch alone within the first run.

The design isn't flashy, but it's thoughtful. At around 30 grams, the headset is featherlight, and the wrap-around band has just enough give to feel comfortable but not loose. It's not jewelry; it's gear.

Battery life and charging

Battery life is one area where I honestly expected a compromise – after all, an
