

Lenovo Yoga Pro 7i Aura

Stylish, smart and built for creators

Deadlines don't wait and ideas don't pause. In today's always-on world, the last thing anyone needs is lag, washed-out colours or a dying battery cutting their flow short. After all, creativity demands performance, precision and reliability working together in perfect sync. That's where Lenovo's Yoga Pro 7i Aura Edition steps in, promising to be the kind of laptop that doesn't just keep up but pushes you to do more.

Even though my work doesn't involve heavy video editing, it does rely heavily on visuals, editing images, curating content and ensuring every piece looks just right on the website. And with a to-do list that seems neverending, what I need is something light, portable and powerful enough to handle everything. The Yoga Pro 7i Aura Edition checks most of those boxes.

I have been using the laptop for the last few days and have genuinely enjoyed the overall experience. But should you spend close to a lakh on it? Let's find out.

DESIGN AND DISPLAY

Minimalism is clearly the design language here. The Lenovo Yoga Pro 7i Aura Edition comes in a refined Luna Grey colour that instantly gives off a professional vibe. The branding at the back is subtle, and the overall design feels like it means business. There's no flashy finish or unnecessary accents, and that simplicity works in its favour.

The laptop feels sturdy and compact and can be carried around without effort. At 1.5 kg, it strikes a nice balance between portability and presence, so it doesn't feel flimsy in hand or heavy in a backpack. It's built for professionals

₹1,03,600

who move a lot during their day, and after several commutes with it tucked into my bag, I can confirm it's kind on the shoulders. That said, those who prefer bold or vibrant colour options might find the design a little understated.

The hinge opens up 180 degrees, which makes it flexible for most work setups. There's a very slight wobble if you open the lid too quickly, but it's nothing alarming. Otherwise, the hinge feels strong and stable.

Now let's talk about the display, which is easily one of the biggest highlights here. You get a 14.5-inch OLED panel with 3K (3000×1876) resolution and a 120 Hz refresh rate. The screen looks stunning, with deep blacks, vivid colours and a sharpness that brings images to life. During our internal testing, it showed 100 percent sRGB accuracy, which is exactly what creators need when colour precision matters.

In real-world use, the experience is excellent. I watched Netflix, scrolled through YouTube videos and edited images for work, and everything looked

crisp and true to tone. The display is slightly reflective, which is common with OLEDs, but a small angle adjustment in a bright office space fixed that quickly. It's also a touchscreen, which makes it convenient when you're feeling too lazy to reach for the keyboard or just want to doodle in MS Paint.

KEYBOARD AND CONNECTIVITY

The first thing you notice when you open the laptop is the clean, evenly spaced keyboard. I usually use a MacBook Air as my daily driver, but switching to this one felt effortless. The keys are responsive and satisfying to type on, offering tactile feedback that makes long writing sessions comfortable. There are plenty of shortcut keys integrated into the function row, and there's

even a dedicated Copilot key that brings Microsoft's AI assistant to life instantly.

The touchpad is large and smooth, responding well to taps and gestures. It has a premium finish, though it does tend to collect fingerprints after a few days of use, so keeping a microfibre cloth nearby isn't a bad idea.

In terms of connectivity, Lenovo has done a great job. On the left, there are two Type-C ports, a card reader and an HDMI port, which makes connecting external displays or transferring photos from a camera quick and simple.

On the right side, you get two USB Type-A ports, a headphone jack and the power button. One thing worth mentioning is that the placement of the power button on the side, instead of the keyboard deck, took me a few moments to spot. But once I got used to it, it felt quite convenient.

PERFORMANCE, BENCHMARKS

Performance-wise, the Lenovo Yoga Pro 7i Aura Edition impresses. It runs smoothly even with multiple Chrome tabs open, image editing software running in the background and music
