

■ **WINDOWS UPDATES**

Microsoft might soon add haptic feedback to laptops

Microsoft may soon add haptic feedback to Windows 11, making the OS feel more tactile and responsive. Hidden in recent Dev and Beta preview builds, a new Haptic Signals menu shows a toggle and intensity slider, hinting at subtle vibrations for actions like snapping windows or dragging files. The feature is expected to work first on

haptic-enabled trackpads such as those on Surface Laptop 7 and Laptop Studio 2. It isn't active yet, but its appearance suggests testing could begin soon. tinyurl.com/g94eh1e

■ **BROWSER AND SECURITY UPDATES**

Google rolls out emergency Chrome security update

Google has released an urgent security update for Chrome after discovering a zero-day flaw (CVE-2025-13223) actively exploited by attackers. The bug in Chrome's V8 JavaScript engine allows malicious sites to corrupt memory and even run harmful code. Users on Windows, macOS and

Linux must update immediately by checking About Google Chrome and restarting the browser. Other Chromium-based browsers may also be vulnerable until patched. tinyurl.com/98t1ds

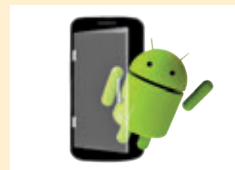

Mozilla to enhance Firefox with new AI window

Mozilla is preparing a new opt-in Firefox feature called AI Window, which will sit alongside Classic and Private modes. Unlike

other browsers that push constant AI interaction, AI Window gives users control, letting them access preferred assistants only when they choose. It builds on Mozilla's recent AI tools such as sidebar chatbots, link summaries, translations and iPhone shake-to-summarise. The feature isn't available yet, but users can join a waitlist. Mozilla says AI Window aims to enhance browsing without forcing AI on users. <https://tinyurl.com/81jhxz>

Google revises Android developer rules, adds flexibility

Google is softening its controversial plan that would have forced all Android developers, including those distributing apps outside the

Play Store, to undergo strict identity verification. Following heavy criticism from groups like Keep Android Open and F-Droid, Google now says experienced users will still be able to install apps from unverified developers through an "advanced installation" flow. The company will also introduce a lighter account type for students and hobbyists. tinyurl.com/8e26age
