AI is moving scarily fast: OpenAI's 2025 progress report explained

When OpenAI says artificial intelligence is moving faster than people realise, it isn't exaggerating. Its 2025 AI Progress and Recommendations report outlines a near future where AI systems could start making small scientific discoveries by 2026, and major ones before the decade ends.

The report makes a bold claim, today's systems are already "80% of the way to being AI researchers." Instead of waiting for an AGI moment, OpenAI argues we're living in it. Costs are plummeting too, with the "cost-per-unit of intelligence" falling about 40× each year.

By OpenAI's estimates, early AI-driven discoveries will start with optimised experiments and subtle pattern-finding. Everyday life may appear stable even as AI solves increasingly complex problems behind the scenes.

Project Suncatcher: Google's crazy plan to host an AI datacenter in space

With Project Suncatcher, Google is exploring a future where AI infrastructure lives in space, powered by unending sunlight and connected via high-speed laser links. They want to take AI training off Earth and into orbit, where energy is free, cooling is easier, and space is vast. Constellations of satellites equipped with solar panels and TPUs, operating in sun-synchronous orbits to harness near-continuous solar energy. tinyurl.com/wnbioo

Mustafa Suleyman's AI plan for Microsoft beyond OpenAI

Microsoft AI chief Mustafa Suleyman, the DeepMind and Inflection AI co-founder, stirred debate with his essay "Towards Humanist

Superintelligence." Suleyman clarified that his vision isn't about building a single untethered AGI. Instead, he

argues for specialised, human-anchored superintelligences in fields like medicine and energy. tinyurl.com/87gr3q
