

Corsair Sabre V2 Pro Ultralight

Does this 36-gram mouse live up to the hype?

The first thing you notice about the Corsair Sabre V2 Pro Ultralight is how unbelievably light it feels. At just 36 grams, it's almost disorienting the first time you pick it up, like holding air. I remember taking it out of the box and thinking, there's no way something this light can actually feel good to use. I'm used to a 110-gram mouse, something that feels sturdy and solid in hand. The Sabre felt like the exact opposite of that.

But here's the thing: that initial disbelief slowly turned into appreciation. Two weeks in, this little mouse had completely changed how I think about gaming peripherals. There's a certain magic in how effortlessly it glides, how accurately it tracks, and how quietly it gets the job done without showing off.

What struck me most wasn't the lack of RGB lights or flashy design – it was the precision and comfort hidden underneath that unassuming matte shell. Corsair didn't make this mouse to look cool on a desk setup; they made it to perform. And once I got used to it, it genuinely felt like one of the best gaming mice I've ever used.

OUT OF THE BOX

When you open the box, you're greeted with just the essentials. No extra bells and whistles – just a USB Type-C cable, a 2.4 GHz wireless dongle, a pair of grip stickers, and replacement feet. That's it.

At first glance, it felt underwhelming. But that minimalist approach makes sense once you hold it. The Sabre V2 Pro weighs just 36 grams – so light that

₹10,499

it almost feels unreal if you're used to heavier mice. I normally use a 110-gram mouse, so switching to this had me learning how to aim all over again. My first few rounds of Valorant were rough. My flicks were overshooting, and I was missing easy shots. But after a few games, something clicked. My hand adapted, the movements started flowing naturally, and suddenly the Sabre felt like an extension of my arm.

FEATURES AND SPECS

The Corsair Sabre V2 Pro Ultralight might look plain, but what's inside is what really counts. It packs Corsair's Marksman S optical sensor, capable of going up to 33,000 DPI, though realistically I kept it at 800 like most FPS players.

The polling rate can go as high as 8,000 Hz, but I tested it at 1,000 Hz – the standard sweet spot for stable wireless performance. The results were impressive. The tracking graphs were consistent, showing almost no jitter or acceleration, and the polling rate stayed rock-solid throughout my tests.

Instead of optical switches, Corsair has gone with custom tactile mechanical switches here, which is a small trade-off to achieve its ultralight weight. They feel crisp, snappy, and good enough to click –

no mushiness, no lag. Plus, mechanical switches consume less power, which means a longer battery life.

The included grip stickers add just the right amount of control if you prefer a firmer hold. The mouse connects either wirelessly over 2.4 GHz or via USB-C cable, and that duality makes it extremely convenient.

PERFORMANCE

Once I got past the initial adjustment phase, the Sabre V2 Pro completely changed how I played. It's built for FPS gaming, and it shows. The tracking is flawless, the motion feels organic, and the weight makes it effortless to move quickly and precisely.

Each dot represents a data update tied to the mouse's polling rate, meaning a 1,000 Hz mouse should record one update every millisecond.

I tested it primarily in Valorant, and after just a few rounds, my aim consistency improved noticeably. Every flick felt smoother, and there was a certain level of comfort that's hard to describe. It was as if the mouse could anticipate my every move, responding the instant I even thought about flicking.

I also tried it in games like Red Dead Redemption 2 just to see how it handled slower, more cinematic gameplay. It was fine but nothing special. The Sabre really shines through in competitive shooters. That's its natural habitat.

The Corsair Marksman S sensor is genuinely one of the best I've used. The tracking graph captures how the mouse accelerates and slows down during a quick flick, with the curve peaking at the point of maximum speed. The tightly packed dots along the curve show that the sensor tracked the movement smoothly and consistently throughout the motion. It's consistent, responsive, and precise. Exactly what you want when milliseconds matter.

BATTERY

The battery life on this thing is honestly impressive. Corsair claims around 70
