

Apple Macs powering enterprise AI workflows

From the creative studio to the corporate boardroom, Apple Macs are gaining ground

Manas Tiwari | editor@digit.in

Across the world, and increasingly in India, Apple's computers are quietly reshaping the enterprise landscape. They are being used by small and medium businesses (SMBs) to large global organisations. This growth is driven by Apple Silicon, on-device AI and a total cost of ownership story that's hard to ignore.

A recent conversation with Colleen Novielli, Apple's Product Marketing lead for Mac, and Jeremy Butcher, Product Marketing lead for Enterprise, shed light on how Apple is positioning the Mac not just as a powerful personal computer, but as an enterprise-grade productivity platform.

Novielli says the MacBook Air has quietly become one of the most popular enterprise choices across the world. "It starts at 16GB of unified

memory, supports dual displays with the lid open, and delivers all-day battery life," she says.

The Air's balance of power, portability and affordability makes it an ideal choice for companies looking to equip their workforce at scale.

"Within any enterprise, you'll have different types of roles from creators and researchers who might use the MacBook Pro, to everyday productivity users who find the MacBook Air perfect," Novielli explains. "The Air fits beautifully across this spectrum." That's a strategic point for Apple.

AI workflows, powered by Apple Silicon

If there's a single theme shaping the enterprise computing conversation today, it's AI. While Apple is yet to take a major leap in that direction, Novielli

points out that every Apple Silicon chip since the M1 has been optimised for AI, and with the latest M5 processors, that focus has only intensified.

"Every aspect of the chip in Apple Silicon is optimised for AI. Now, with neural accelerators in the GPU, AI-intensive tasks are even faster," she said, while citing the example of HaiDiLao, the global hotpot restaurant chain, which operates over 1,300 outlets worldwide serving 450 million customers a year. The company uses Mac mini and Mac Studio systems to power AI-driven guest services that range from table availability tracking to order accuracy and kitchen safety. The results? "They've reported 78% energy savings and a projected 52% cost savings over three years," Novielli notes. "And with the new MacBook Pro and M5 chip, those AI capabilities extend to more mobile, on-device workflows."

Lower costs, higher satisfaction

One of the strongest factors driving enterprise Mac adoption, according to Butcher, is lower total cost of ownership. "We hear from organisations that support costs go down significantly," he says. When asked about Apple's enterprise strategy in India – particularly around affordability and AI readiness – Novielli points to two major pillars: the company's foundational investment in Apple Silicon and its strong and growing partner ecosystem in India.

"Apple Silicon provides the foundation for AI capabilities in the Mac," she says. "Our hardware – CPU, GPU, and Neural Engine – combined with macOS frameworks, enables both built-in intelligence features and powerful third-party AI tools. So whether you want to use AI or create AI, the Mac is the best platform for you."
