

Customising Find X9 Series for India

Peter Dohyung Lee, Head of Product Strategy at Oppo, explains it all

Bharat Upadhyay | editor@digit.in

Oppo recently launched its flagship Find X9 series smartphones in India with powerful cameras, a huge 7000mAh battery, advanced AI features and more. Beyond the specs, the company says the biggest highlight is how deeply the Find X9 and Find X9 Pro have been customised for India.

At the launch event, Peter Dohyung Lee, Head of Product Strategy at Oppo and Goldee Patnaik, Head of Brand and PR Communications at Oppo India, explained how Oppo customised the Find X9 series for India.

Peter said Oppo's camera focus wasn't a sudden shift, it has been building up for years. India is a photography-heavy market and Oppo's internal usage data confirms it.

"Indian users take almost three times more photos than Chinese users," he pointed out. This long-term behaviour was a major reason why Oppo doubled down on imaging across all its series, from Reno to F-series and now the Find X line up.

Goldee added that India's premium smartphone market is growing at an unprecedented pace. He said the premium segment has grown 40%, while the ultra-premium category grew 50 per cent, with Oppo now holding a 13.98 per cent market share, making it the number-two brand.

"In this phase of premiumisation, consumers are clearly choosing two things – camera and battery. That combination is driving buying deci-

sions today," he said.

This shift pushed Oppo to take a more aggressive camera-first approach for the Find X series. Battery life emerged as a major pain point in Oppo's research across Indian cities. Peter said Indian consumers want longer usage without worrying about charging, especially with increasing video consumption.

According to him, SuperVOOC made a huge difference. "And we always listen seriously to consumer pain points. Battery is a continuous unmet need," he explained.

Even with a 7,000mAh battery, Peter believes users will still want more as their usage grows. But Oppo says it will keep improving with every new generation.

Goldee added that Oppo's product teams travel extensively across India to gather real feedback. This ground-level research helped Oppo design a device that delivers a complete flagship experience instead of just hardware upgrades.

Lumo: Camera engine tuned for India

One of the biggest upgrades this year is Lumo, Oppo's new computational photography engine. Peter broke down how it works behind the scenes

– sensors capture raw light data, and the Lumo engine processes it using dozens of algorithms for de-noising, scene detection, colour management and more.

But what makes Lumo special in India is the Lumo Lab, where Oppo's global imaging team collaborated directly with top Indian photographers and creators. They studied local lighting, skin tones, festival colours, crowded street scenes and even traditional outfits. Peter said this collaboration led to a very clear difference between the China and India versions of the phone.

"Even with the same Lumo engine, the camera tuning for India is completely different," he said. The result

is imaging performance that is noticeably better suited for Indian scenarios, especially portraits, night shots and bright outdoor photography.

The Find X9 series comes with AI Mindspace, Oppo's new AI-powered personal memory and assistant system. Peter said India and China have very different AI ecosystems, so Oppo created a global algorithm and integrated it with Google Gemini for better contextual understanding.

Mindspace analyses screenshots and notes a user saves and privately stores key details on their personal cloud. Nothing is shared outside the device at any given time.

Goldee explained that Mindspace can then use this data to create personalised plans – for example, making a full Dubai travel itinerary based on saved preferences like vegetarian food, museums and attractions.

"Oppo always listens. If Indian users need Indian AI services in the future, we will definitely explore it," Peter said without hesitation. **■**
