

One wallet to rule them all

Samsung explains how its wallet can replace everything else

Bharat Upadhyay | editor@digit.in

Samsung is taking a big step forward with its digital wallet in India. What started years ago as Samsung Pay has now grown into a complete Samsung Wallet – an all-in-one app that brings together payments, ID cards, travel passes, and even digital car keys in one place. The South Korean giant has introduced new features including UPI integration, DigiLocker access, biometric payments and digital keys for Mahindra EVs.

These updates are designed to make life easier for Galaxy users, helping them pay, travel and access their digital IDs securely from just their smartphone. During a roundtable discussion with the media, Madhur Chaturvedi, Senior Director, Services & Apps Business at Samsung India, outlined the company's vision for Samsung Wallet.

Integrating UPI into Samsung Wallet

Samsung has worked with NPCI to bring UPI account setup directly into the new-device setup process. That means when you unbox a new Galaxy phone, you can link your UPI account right away without any separate app.

Responding to a question about how UPI integration was implemented and what challenges were faced in collaboration with NPCI, Chaturvedi told Times Now Tech that the goal was to make UPI setup frictionless, particularly for users switching to a new phone.

& Apps Business,
Samsung India

“Our objective is to catalyse early UPI adoption for anyone setting up a new device. During the device setup journey users will be able to directly link their UPI accounts and bank securely. This functionality already exists in Samsung Wallet, but we’re now bringing it upfront into the setup flow,” he said.

“Rather than users having to search, download or transfer UPI apps, they can now set it up instantly. The entire flow was thoroughly tested with NPCI and both sides are excited about how this simplifies digital onboarding,” he added.

When asked if the feature would only be available on Samsung’s premium Galaxy S and Z series phones, Chaturvedi clarified that UPI support will be available across all devices that support Samsung Wallet. He said that UPI is not limited to flagship phones and will work on every Samsung

device, adding that the goal is to give all users a consistent and secure payment experience.

Forex card integration

The updated Samsung Wallet now supports Forex Tap & Pay through a new partnership with WSFx Global Pay, which allows users to pay abroad. The company has also expanded support for AU Bank credit and debit cards, with more issuers expected soon.

When asked whether the newly announced Forex card feature can simplify travel for frequent flyers, he said the idea was to eliminate the hassle of maintaining multiple cards.

“Our first partner for the Forex card is GlobalPay, that’s our initial implementation. However, we plan to expand this service to other banks soon. For now, users will need to have a GlobalPay Forex card to access the feature.” The company believes this unified approach will help travellers manage international spending more seamlessly directly through their smartphones.

Biometric authentication for payments

Samsung is also making digital transactions smoother with biometric authentication for UPI payments. Soon, users will be able to approve low-value transactions just by using their phone’s fingerprint or face recognition, skipping the need to enter a UPI PIN each time.

This update is expected to roll out by December 2025 and will apply across Samsung Wallet-compatible Galaxy devices. Samsung Wallet continues to have DigiLocker integration.

Security and Knox protection

“Everything on Samsung Wallet, whether it is a credit card, debit card, car key, or home key — is safeguarded by Knox, deeply integrated into the hardware and software layers, protected from potential threats, including ghost tapping,” Chaturvedi said.
