

For gaming, the OnePlus 15 supports a 165Hz refresh rate and can push very high frame rates in select titles. In testing, it peaked to 167 FPS and delivered an average of 143FPS in Call of Duty: Mobile Team Deathmatch. However, this is where the limitations show. The 165FPS mode only works in Call of Duty: Mobile, and only in Team Deathmatch. In BGMI, which is far more popular among Indian gamers, the phone maxed out at around 121FPS, making the lack of 165Hz support a bit disappointing.

While the OnePlus 15 doesn't fully use its high refresh rate in most games yet, it still delivers solid and stable gaming performance overall.

On the software side, the OnePlus 15 runs on OxygenOS 16, based on Android 16. The update doesn't change things drastically compared to OxygenOS 15, but it brings a number of small improvements. The interface now leans heavily towards a cleaner, more modern look. You'll notice more transparency across menus, quick settings, and system panels, along with softer blur effects.

CAMERA

Now, let's talk about the cameras. This year, OnePlus ended its partnership with Hasselblad and created its own camera system called DetailMax. The phone has three cameras at the back: a 50-megapixel Sony IMX906 main camera, a 50-megapixel ultra-wide

camera, and a 50-megapixel telephoto camera with 3.5x optical zoom. On the front, there is a 32-megapixel camera for selfies and video calls.

In bright outdoor light, the OnePlus 15 takes really good photos. The images have a good balance between bright and dark areas, and the colours look natural. Skin tones are accurate, and you get good detail without artificial sharpness. The pictures come out clear and colourful. But when you're shooting in tricky lighting situations, the camera sometimes struggles. You might lose some detail in shadows or bright spots. Portrait shots are good overall. However, the edge detection isn't always precise, particularly around hair.

In low-light shots, the camera handles noise reasonably well. The images

aren't always super sharp, but they don't look bad. You can still get good photos in dim lighting, making the camera dependable for everyday low-light use.

So, the camera system is capable and reliable, even if it doesn't match the very best camera phones available today.

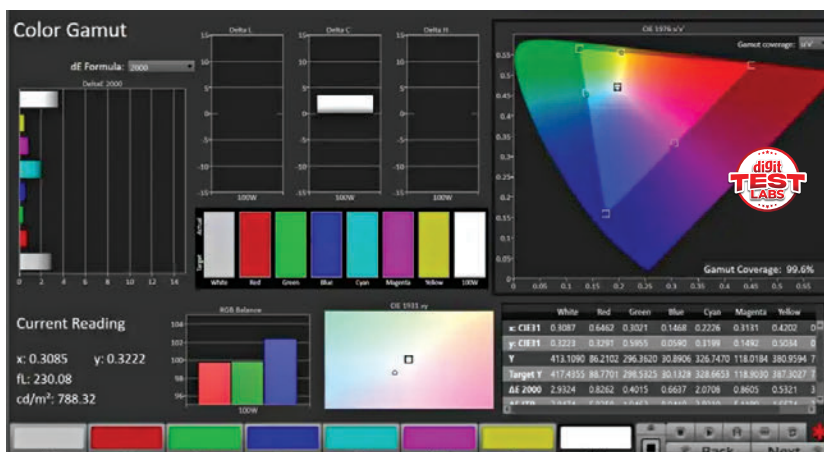

VERDICT

The OnePlus 15 feels like a brand trying to rediscover its strengths. By moving away from the Hasselblad partnership and introducing its own DetailMax camera system, doubling down on performance and gaming, and adding a massive 7,300mAh battery, OnePlus is clearly focusing on power, efficiency, and endurance. The 165Hz display and Snapdragon 8 Elite Gen 5 further reinforce that direction.

There are still compromises. While the camera system is dependable and delivers good results in both daylight and low-light conditions, it doesn't quite compete with the absolute best camera-centric flagships. And the removal of the iconic alert slider may disappoint long-time OnePlus fans.

If camera performance is your top priority, the OnePlus 15 may not be the best choice. But if you want good performance, excellent battery life, and a good viewing experience, the OnePlus 15 stands out as a well-rounded and sensible flagship option.
