

Vivo X300

New generation, fresh energy

If there is one thing that still decides whether someone splurges on a flagship

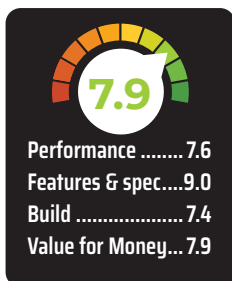

phone, that's definitely the cameras. People usually want something that makes their photos look like a beautiful memory, and the serious buyers, who upgrade their phones once every two or three years, will not settle for anything less than what we call a 'big upgrade'. For a long time, Apple and Samsung were the go-to options for those looking for high-quality camera phones. However, over the past few years, Vivo has quietly shifted the conversation with its Zeiss partnership, smarter AI and impressive camera optimisation.

That brings us to the Vivo X300. I've been using it for a while, and my first impression is straightforward: it looks fresh, feels sleek, and the camera system makes an immediate statement. However, the real question is not whether it looks good. The question is whether the X300 truly improves on the X200, and, more importantly, whether it can compete with the rivals. Here is what I think.

DISPLAY

The Vivo X300 may appear compact on the outside, but its display performance is pretty impressive. This device features a 6.31-inch LTPO AMOLED panel with a resolution of 2640 × 1216, slim bezels and SCHOTT Xensation XT Core protection. Vivo has included all the flagship essentials, such as 120Hz refresh rate, 1B colours, HDR10+, HDR Vivid, and 2160Hz PWM dimming, and on paper, it looks complete. If you hold it, the first thing that stands out

₹75,999

is the visual punch. The colours are vibrant but not oversaturated, the viewing angles are excellent, and the screen feels crisp and expressive whether you're scrolling through social media or reviewing photos.

In our brightness test, we measured up to 995 nits manually and a massive 3,340 nits peak under adaptive brightness, which is more than sufficient for harsh outdoor visibility.

Using Calman and the SpectraCal C6 HDR2000 colorimeter, the X300 produced reference-level results:

- Average DeltaE 2000: 0.8 (a near-perfect score),
- Max DeltaE: 1.4,
- Gamut coverage: 99.8%,
- Contrast ratio: 107,385:1,
- White point: 6621K, extremely close to the D65 standard.

Simply put, the display is so well-tuned that even professional creators

will struggle to find flaws. Greyscale tracking is precise, RGB balance is consistent, and the gamma curve is nearly perfect, with just a hint of added contrast for a punchier look, something most users will prefer.

PERFORMANCE

The Vivo X300 packs MediaTek's new Dimensity 9500 chipset, which is built on TSMC's 3nm N3P process and features an all-big-core CPU layout. On paper, it promises major gains in efficiency and peak performance, and Vivo equips it with up to 16GB of LPDDR5X RAM and 512GB UFS 4.1 storage. This combination alone creates the perfect conditions for quick app launches, faster photo processing, and fluid multitasking.

In everyday use, the X300 does just that. Scrolling through social media, switching between apps and taking photos while moving around the city all feel smooth.

This new software is also a big shift for Vivo. After years of using Fun-touchOS globally, the brand has finally brought its more refined OriginOS outside China, and it shows. The interface feels much cleaner and more cohesive, with menus, icons, and animations that flow together naturally. The modern visual style gives the phone a more premium character.

Also, it's not just about looks, either. Vivo has fine-tuned the small details, the way gestures respond to touch, the smoothness of scrolling, and the way animations look and feel, all of which make the phone feel faster and more fluid in everyday use. Add to that the promise of five major Android OS updates and seven years of security support, and OriginOS 6 easily stands out as one of the most meaningful upgrades the company has rolled out in years.

However, coming back to numbers, here are some benchmark scores for those interested.

The X300 scored:

- AnTuTu: 3,054,648
