

Samsung S95F OLED TV

Big, bright, beautiful and one of the best

₹4,37,990

The Samsung S95F OLED arrived in the Digit test labs as a 77-inch showpiece, the kind that makes everyone stop what they are doing and gather around. Even the unboxing drew a crowd, and the panel's striking visuals kept colleagues standing there longer than expected. The TV boots in Retail Mode by default, which explains the jaw-dropping screensavers meant to catch attention, but the real work began once we switched to Home Mode and calibrated it for a fair comparison with two other OLED contenders for 2025: The LG Evo G5 and Sony Bravia 8M2. This review focuses on how the Samsung S95F performs in everyday use, supported by its core features, which include the Tizen interface with seven years of updates, support for multiple voice assistants, a 100Hz native refresh rate, four HDMI 2.1 ports, gaming-friendly tools, and a 70W speaker system. To give you a heads-up, the 55-inch variant of S95F recently won the

Best Buy award at the Digit Zero1 Awards, helped by a relatively accessible starting price (Rs 1,60,990), but there are clear performance reasons behind that win. This review explains what they are.

At Rs 4,37,990, the 77-inch Samsung S95F

stands out for its bright panel, wide colours, fast gaming response, matte anti-glare finish, clean One Connect setup, feature-rich Tizen UI, and strong software support. The trade-offs are artefacts, and audiovisual fidelity that shows only when compared against its rivals. Even so, it remains a solid pick for anyone who wants a big, bright and beautiful OLED TV.

DISPLAY TEST

The Samsung S95F delivers vibrant colours, impressive HDR performance and near-perfect contrast. Samsung claims up to 4,000 nits of brightness in a 3% window. In our testing with Vibrant mode, S95F remains brighter than LG G5 and Sony 8M2, with up to 1,120 nits

in a 25% window. LG hits roughly 1,050 nits, and Sony hits 750 nits in that same window size.

The viewing angles on the Samsung TV are great, and even if you move to the side seats, there will be no colour shift.

The Samsung S95F pulls ahead of most OLED models using glossy panels. Glossy panels reflect more light during the day, which can be distracting. Samsung carries over the matte anti-glare finish here, which thwarts reflections to a great extent, and visuals remain enjoyable in bright and dark rooms.

Largely being the operative word. During the TV's initial bootup, I noticed a faint glow around the white Samsung logo on a black background. This was also visible on white subtitles in dark scenes. It happens because small bright objects, like subtitles or the logo, have very strong contrast against black. The matte coating on the screen scatters a little of that bright light as it disperses reflections, so thin white edges look slightly fuzzy. You can tweak brightness and sharpness to reduce it, but it's a minor artefact and nothing to worry about.

When it comes to colours, the Samsung S95F achieved Delta E values averaging around 3 in SDR and 1.6 in HDR, while LG posted even stronger results with 2.1 and 1.1, respectively. Sony's averages sit close between them. Samsung does, however, show extremely wide colour coverage, hitting over 88% of BT.2020 and nearly 100% of UHDA-P3. LG and Sony sit in a similar range, but LG has slightly weaker BT.2020 coverage than Samsung.

Unlike the LG G5 and Sony 8M2, the Samsung S95F does not support Dolby Vision. It relies on HDR10+, which looks strong on this bright, colour-rich panel. Unless you are particular about or often watch content mastered in Dolby Vision, the S95F delivers a comparable experience.

Most visuals stand out on the large screen. The size helps pull out finer details in some scenes, though you may notice grain or mild pixelation at times.
