

like feel, and it does a solid job of staying smudge-free even after long use. Yes, 210 grams is on the heavier side, but the weight is balanced. It sits in the hand with a certain confidence. Add IP64 protection and Gorilla Glass 7i, and you get the sense that Motorola didn't cut corners in the places that actually matter.

Displays

On paper, the Moto's 6.7-inch IPS LCD almost feels like it's walking into a fight it shouldn't win. But once you look at the numbers, it's clear Motorola took the display seriously. A Delta E of 1.0 is genuinely impressive, with colour coverage touching 99%, peak brightness around 1030 nits and consistent white balance. It's one of those screens that surprises you because you weren't expecting an LCD to behave this well. It still can't match OLED blacks, but in actual use, it feels tuned, clean, and comfortable.

The Galaxy M17 swings the conversation the moment it lights up. Samsung knows AMOLED better than almost anyone, and even a budget Samsung panel carries that signature pop. Blacks look perfect, contrast jumps immediately, and at 1450 nits peak brightness, you never struggle outdoors. Sure, the refresh rate is 90Hz instead of 120Hz, but unless you're deliberately looking for the difference, the smoothness feels more than adequate. A Delta E of 1.3 is also solid, though Samsung leans into saturation because they know most people enjoy the extra punch.

Performance

The Moto G67 Power runs Qualcomm's Snapdragon 7s Gen 2, and you can feel the extra muscle right away. The moment you start switching between apps or scrolling aggressively, the phone responds with ease. Gaming is where the difference gets louder. In BGMI and Call of Duty Mobile, the frame rates stay steadier on the Moto, and even longer

sessions don't heat it up the way many budget phones tend to. Benchmarks reflect the same story with higher numbers across CPU and GPU, but more importantly, a smoother experience when it actually matters.

Samsung's Exynos 1330 isn't trying to compete with that. It's built for efficiency and predictability. Daily tasks such as social media, videos, calls, and minor multitasking, everything moves without trouble. But open a graphics-heavy game, or switch too quickly between demanding apps, and you'll feel the slight hesitation.

Software experience

Software makes this split even wider. Moto's Hello UI tries to keep things clean and light, close to stock Android. That simplicity is nice, though this is the first time I've seen Motorola bundle this many pre-installed apps. It's still manageable, but noticeable.

Samsung's One UI 7 is the opposite. Rich, detailed, full of features and customisation options. It's heavier, but it gives you more control over how you want the phone to feel day to day. And then comes Samsung's biggest trump card in this comparison: six years of OS

updates, which is unheard of at this price. Suddenly, the performance difference of today feels smaller when you think about which phone might age better.

Cameras

The Moto G67 Power tries to stay loyal to reality. Colours are neutral. Greens lean slightly muted, and skies are sometimes softer than they should be. HDR is the weak point here; shooting against strong light often blows out highlights. Portraits are pleasing, but sometimes lack edge definition, especially in complex backgrounds.

The Samsung Galaxy M17 is a crowd-pleaser. It enhances colours, brightens skies, and adds a warm touch to skin

tones. It may not always be accurate, but it looks good. HDR performance is stronger too, pulling back skies and recovering shadows with ease. Close-ups are punchier, portraits sharper, and selfies generally more flattering.

Verdict

The Moto G67 Power is for people who value reliability. It focuses on consistency: great battery, strong performance, near-stock software, rugged design. It's the kind of phone that feels dependable, steady, always ready.

The Samsung Galaxy M17 is built for users who want a bit more finesse. The AMOLED display is a nice touch. The cameras feel social-ready out of the box. The design looks sleeker. And that long software support makes you feel like your money is being respected.

For me, the Moto wins the raw battle. It gives you more for your money if you only measure the numbers. But Samsung wins the experiential battle. It feels nicer when you aren't counting specs and when you're watching something, shooting a quick photo, or just checking a message. Both phones win in completely different aspects, but what you value decides your champion. **d**
