

■ VOICE ASSISTANT UPDATES

Apple's Gemini-powered Siri may debut with these AI features

Apple is reportedly closing in on the rollout of its fully revamped AI powered Siri, following its announced partnership with Google Gemini. According to a report from The Information, an early version of the upgraded assistant could arrive this spring as part of iOS 26.4. The new Siri is expected to be more conversational, context aware, and task focused, with abilities

ranging from answering general knowledge questions naturally to handling complex tasks like travel planning and content creation across

apps such as Notes. Apple is also said to preview additional Siri upgrades at WWDC in June, including memory of past conversations and proactive suggestions using data from apps like Calendar and Mail. While Gemini will power some capabilities behind the scenes, Apple is reportedly fine tuning the models to match its own design language, with no visible Google branding. tinyurl.com/s81hsa1

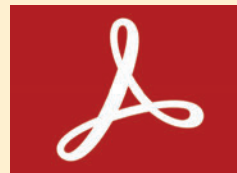

WhatsApp Web could soon let users make group calls

WhatsApp is reportedly developing group voice and video calling support for its web version, allowing users to place calls directly from

a browser without relying on a smartphone. According to leaks shared by WaBetaInfo, the feature is currently under active development and was spotted in a recent beta update. Once rolled out, group calls on the web are expected to mirror the mobile experience, potentially supporting up to 32 participants, though limits are yet to be confirmed. WhatsApp is also said to be working on call invite links and scheduled calls for the web client. tinyurl.com/s81hs4e

Adobe brings AI-powered PDF editing features to Acrobat

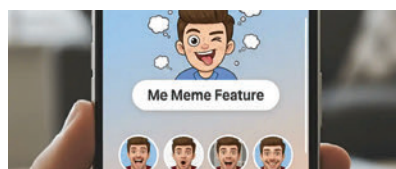

Adobe has announced a new wave of AI features for Acrobat, turning PDFs into more interactive and multi format content tools. Users can

now create presentation decks from documents using chat based prompts, generate podcast style audio summaries for on the go consumption, and edit PDFs through conversational AI commands. Adobe has also improved collaboration with updated PDF Spaces, allowing teams to share files, leave notes, and gather feedback in one place. The company says AI feature usage in Acrobat has grown over four times year on year. tinyurl.com/e72gssa

■ GOOGLE UPDATE

Google Photos introduces Me Meme feature

Google is rolling out a new AI powered feature called Me Meme in Google Photos, letting users turn their own photos into memes directly within the app. First announced in October 2025, the feature is now being released after a three month gap and joins other creative tools like edits, videos, remixes,

and collages. Me Meme works only when users manually select a photo and choose to create a meme,

ensuring the tool does not generate content on its own. Users can pick from popular meme templates, edit captions, or upload custom formats to suit their humour. Google has stressed that privacy remains fully under user control, with memes staying inside the app unless shared or saved. tinyurl.com/2h6gx1
