AMD Ryzen AI 400 chip revealed

Key features explained

Vyom Ramani | editor@digit.in

At CES 2026 in Las Vegas, AMD officially took the wraps off its latest generation of mobile and desktop processors: the Ryzen AI 400 Series. Building on the foundation of the Ryzen AI 300 “Strix Point” chips, the new 400 series

(codenamed “Gorgon Point”) doubles down on the AI PC trend, pushing NPU performance even higher while refining power efficiency to battle Intel’s latest Core Ultra offerings.

A 60 TOPS NPU for the Copilot+ era

The headlining feature of the Ryzen AI 400 series is the upgraded XDNA 2 NPU, which now delivers up to 60 TOPS (Trillion Operations Per Second) of AI performance. This is a roughly 20% increase over the previous generation’s 50 TOPS. This bump is significant because it comfortably exceeds Microsoft’s 40 TOPS requirement for the Copilot+ PC certification. tinyurl.com/mcrctpec

Qualcomm Snapdragon X2 Plus

Qualcomm’s Snapdragon X2 Plus, announced at CES 2026, is positioned as a mainstream chip for Windows 11 Copilot+ laptops that balance performance, battery life, and cost. Sitting below the X2 Elite, it offers solid CPU and GPU gains, up to 80 TOPS of on-device AI performance, and ambitious memory support, targeting affordable, efficient AI PCs that most buyers will realistically consider in 2026.

NVIDIA at CES 2026

When AI learned to finally touch physical reality

Jayesh Shinde | editor@digit.in

For a few years, and definitely since the ChatGPT moment at the end of 2022, the AI world has been largely obsessed with tuning up intelligence. Bigger models with more parameters trying to perform better on industry benchmarks every few months. But at CES 2026, NVIDIA raised the stakes with a whole new argument – that intelligence alone is useless if it can’t reason, remember, and act safely in the real world.

According to NVIDIA, the next big thing in tech is a world of agentic AI, physical machines, and infrastructure built not just for speed, but better reasoning, with safety and scale in mind.

Rubin isn’t a chip, it’s a reset

NVIDIA’s Rubin platform is being pitched as “six chips, one AI supercomputer,” but frankly that undersells what’s happening under the hood. Rubin is NVIDIA openly declaring that the future of AI performance no longer lives inside a single processor. tinyurl.com/zu4em8zh

Intel Core Ultra 3 AI chip is a go

Intel unveiled Core Ultra Series 3 “Panther Lake” at CES 2026, its first consumer chips built on the 18A process, marking a major milestone for its IDM 2.0 strategy. The lineup introduces new X-series tiers with up to 16 cores, big GPU gains, improved battery life, and 50 TOPS AI performance. Targeting power users and AI PCs, Series 3 promises desktop-class performance in thin laptops starting January 2026.
