Future Handheld Gaming PCs

Intel revealed custom chips

Vyom Ramani | editor@digit.in

For the past three years, AMD has guarded the handheld PC market fortress, with its Ryzen Z-series powering staples like the Steam Deck and ROG Ally. At CES 2026, Intel shattered that status quo. CEO Lip Bu Tan unveiled a dedicated strategy to conquer the sector, headlined by the new Intel Core G3 processor.

The Core G3 and Arc B390

Unlike previous attempts that forced laptop chips into handheld chassis, the Core G3 is a hardware-specific variant of the Panther Lake CPU, built on Intel's proprietary 18A process node. The chip's standout feature is the integrated Arc B390 graphics unit. Intel's performance claims are aggressive:

- A 77% leap in gaming performance over the previous Lunar Lake architecture.
- A 73% average performance lead over AMD's current standard, the RDNA 3.5 iGPU.
- Most notably, the Arc B390 reportedly outperforms the discrete Nvidia RTX 4050 mobile GPU by 10%.

NVIDIA G-Sync Pulsar

Why it matters to gamers

Divyanshi Sharma | editor@digit.in

It is one of those almost invisible problems most gamers have learnt to live with. But at CES 2026, NVIDIA decided it was time to tackle that problem.

The company has just unveiled G-SYNC Pulsar, a new form of its display technology that promises something many gamers have wanted for years – ultra-clear motion without sacrificing smoothness. For esports players and anyone who takes fast-paced games seriously, this could be one of the most important upgrades in a long time.

The G-Sync Pulsar promises to remove compromises

In simple words, the G-Sync Pulsar can be called NVIDIA's answer to display motion blur. Unlike in-game motion blur, which is a visual effect you can turn off, display motion blur is a hardware limitation. It happens because LCD pixels take time to change and because traditional backlights stay on constantly. tinyurl.com/4apzt3r2

GAMING PRODUCTS

OhSnap MCON Mobile Controller

I love mobile gaming, but I don't enjoy carrying bulky controllers. The

MCON by OhSnap solves this by being impossibly thin. It attaches to the back of your phone via MagSafe (or an adapter for Android) and sits flush when not in use. When you're ready to play, you slide it out to deploy ergonomic grips and just go!

HyperX Clutch Tachi

Designed for the fighting game community, this "leverless" (hitbox style)

controller uses TMR sensors to guarantee zero drift and frame-perfect inputs. The Razer Wolverine V3 focused on wireless latency, working with LG to reduce Bluetooth lag to sub-3ms levels, making cloud gaming on a TV feel like gaming locally.

ROG Swift OLED PG27AQWP-W

For competitive shooters, the ASUS ROG Swift OLED PG27AQWP-W

is the ultimate upgrade. Its 26.5-inch "TrueBlack Glossy" Tandem OLED panel ensures vibrant colours. With a 0.02ms response time and AI "Dynamic Shadow Boost" to reveal hidden enemies, this glossy display delivers unmatched speed.
