AI's wonky vision

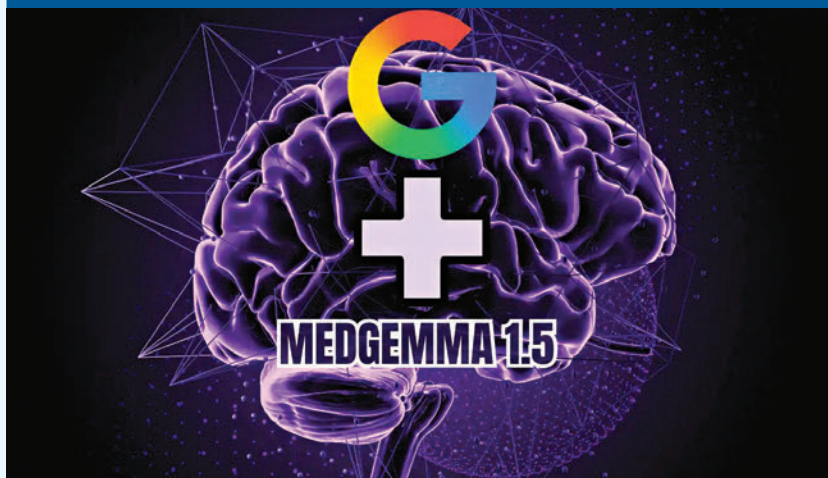

For years, neuroscientists and computer engineers believed that optical illusions were “bugs” in the human operating system – evolutionary shortcuts that left us vulnerable to visual trickery. But recent research suggests these errors are not biological flaws. They are mathematical inevitabilities of any system, biological or artificial, that tries to predict the future.

The phenomenon was first flagged when AI was shown thousands of hours of footage – propellers spinning, cars moving, balls rolling – until it learned the physics of motion.

Then, they showed it the Rotating Snakes illusion. To a standard camera, this image is a static grid of pixels. There is zero motion energy. But when the researchers analyzed the AI's internal vectors, they found the system was “hallucinating” rotation. The AI didn't just classify the image; it predicted that the wheels were turning clockwise or counter-clockwise, curiously. tinyurl.com/nds789

MedGemma 1.5 & MedASR explained

The adoption of artificial intelligence in healthcare is accelerating at nearly twice the pace of the broader economy, driven by the need to manage complex and multimodal medical data. To support this shift, Google Research has released major updates to its open medical AI stack with MedGemma 1.5 and MedASR. Together, they reflect a move away from static analysis toward models that better reflect real clinical workflows. tinyurl.com/s7tg1n

Apple turns to Google Gemini to fix Siri

Apple has signed a multi year deal with Google to power the next version of Siri using Gemini. The upgrade, launching later this year, will base Apple Foundation Models on Google's AI and

cloud technology. While Google supplies the intelligence, Apple says privacy and on device control will remain central, marking a major shift in its AI strategy. tinyurl.com/w7gcz
