

Want to build AI agents?

The simplest ways for beginners to start

Bhaskar Sharma | editor@digit.in

I receive numerous emails and messages every day, and managing them all used to be a challenge. Sometimes it felt like there weren't enough hours in the day to get everything under control. That was exactly the moment when I decided to make AI agents for myself to tackle the mundane tasks of my profession. Though I had an engineering background, I did not want to write the code by hand like the rest of you. Hence, I started looking for beginner-friendly solutions that I could actually use. During this research, I discovered the methods explained in the article below, which you can also use to build AI agents of your own.

No-code platforms

If you're looking for the easiest and the quickest way to get started with your

personal AI agents, then the no-code platforms are your best friend. These tools allow you to create basic AI agents by merely clicking a few buttons. These platforms take care of all the complex things, which include the coding as well.

If you're looking for how you can use them, here are some general steps:

1. Decide on one small, clear task.
2. Choose a no-code AI platform.
3. Write instructions in simple words.
4. Test and gradually improve them.

Some of the best no-code platforms to build AI agents for free include Zapier, Make, N8N (with its open-source version), Relevance AI, MindStudio, Lindy, and Voiceflow.

Automation platforms

If you want a little more control but don't want to do complex coding, automation tools are a simple and beginner-

friendly option for building AI agents. These tools let you connect different apps and AI models so they can work together automatically. If you're looking to get started with the automation-based AI agent, here are the steps:

1. Decide your task or process.
2. Pick a tool that works with AI.
3. Connect the apps and AI model.
4. Set up simple triggers and actions to create a workflow.
5. Test the automation and improve it.

Some popular free tools are Latenode, AutoGen, Flowise, and n8n. CrewAI for building agents that work together.

Frameworks

Using frameworks is another option you can use to build your AI agents. However, unlike the previous options, you would require some coding knowledge to work with frameworks and use them to build your AI agent.

1. Decide what the agent should do and how much freedom it has.
2. Pick an AI system and model for it.
3. Set up its instructions, memory, and how it makes decisions.
4. Connect it to the tools and data.
5. Test it, launch it, watch how it works.

You can build AI agents for free using popular open-source frameworks like LangChain, AutoGen, and CrewAI.

OpenAI Assistants API

OpenAI's Assistants API is yet another option if you want to create an AI agent on your own. Though it's not entirely a no-code solution, it is the most simplified means of building highly advanced AI agents with less coding. Using it is fairly simple, as all you need to do is follow the steps below:

1. Make an assistant with instructions.
2. Add memory or reference documents.
3. Connect tools for specific actions.
4. Test conversations and improve.

Most of the heavy lifting is handled by OpenAI, so you don't need to worry about building the models or managing the infrastructure in anyway.
