

Hisense U7Q Mini LED TV

Practical option under ₹70,000 with fair trade-offs

₹20,900

The Hisense U7Q is a 65-inch QD Mini LED TV that launched in India in June 2025 at Rs 79,999 and is now retailing around Rs 69,999. It came in for the Digit Zero One Awards and was a runner-up for the best-value Mini-LED TV. But there was more to say about the TV than the picture-based metrics on which we decided the best value TV winner. It is specced to impress with a 144Hz refresh rate screen, MEMC, VRR, AMD Freesync Premium, Dolby Vision IQ and HDR 10+ Adaptive format support, Filmmaker mode, a few AI-based enhancements, 4 HDMI 2.1 ports, Vidaa OS, built-in Alexa voice assistant, 47W 2.1 channel three-speaker setup tuned by Devialet, including Dolby Atmos support. After a long time of use, we will share our assessment of how good this TV is for the price.

VISUALS

The Hisense U7Q uses a 4K 8-bit+ FRC panel. It is a Mini LED LCD type with full-array local dimming. You can buy it in 55-inch, 65-inch, 75-inch, 85-inch, and 100-inch models. We got the 65-inch variant, and it is a big enough panel for engrossing movies, shows and any other content in a standard Indian room.

Hisense has added support for HDR formats like Dolby Vision, Dolby Vision IQ, HDR10, HDR10+ and HLG, which is impressive considering some brands exclude certain formats in this range.

In peak HDR brightness testing at a 25% window, the U7Q reached 620 nits, which is lower than some newer Mini LED rivals but still sufficient for most HDR content in living-room lighting. Black levels measured 0.11 nits, which explains why the TV delivers reasonably deep blacks for an LCD, though not OLED-like. In colour coverage tests, the

panel reproduced 94.48% of UHDA-P3, 71.7% of BT.2020, and 98% of BT.709, with an average Delta E of 3.1. These figures point to strong SDR performance, though HDR colour volume is not class-leading.

For comparison, the Lumio Vision 9 posts stronger raw numbers in several areas. It measured 903 nits peak brightness at 25%, significantly brighter than the Hisense. Colour coverage is also wider, with 98.04% UHDA-P3, 82.12% BT.2020, and 100% BT.709, alongside an excellent average Delta E of 1. On paper, the Lumio clearly leads in colour accuracy and peak luminance.

In everyday viewing, the Hisense U7Q offers a comfortable field of view. In a well-lit room, reflections are visible, but they do not significantly interfere with the on-screen image. Colours and contrast do not consistently pop, but the presentation remains stable and easy to watch over long sessions. Filmmaker Mode is available and useful if you want a more authentic picture profile that aligns closer to the creator's intent in movies and shows.

The overall colour temperature leans slightly warm. At times, blues can appear faintly greenish. In certain scenes, colours may look a bit washed out, and subjects on screen do not always stand out strongly due to limited depth and fine detail. These impressions became more noticeable when the TV was viewed alongside a pricier Sony Bravia 5, which offers greater clarity and image separation. That said, at its price, many buyers may not mind the U7Q's softer presentation. Skin tones are handled well, and importantly, there were no obvious blooming artefacts during our use, which is a positive. In the high-speed dogfight in Top Gun: Maverick, the TV also handled motion well.

When it comes to sports content, motion performance is less convincing. During fast-paced cricket matches, the ball occasionally appeared to skip slightly, creating a faint trailing effect. With older SD shows such as Sarabhai vs Sarabhai, detail levels were modest.
