

Sam Altman's viral moment with Anthropic's Amodeli

The moment happened during a symbolic group photograph with PM Modi and other top technology leaders. While others raised their joined hands, Altman and Amodeli lifted their fists beside each other. The clip attracted attention partly because of the shared history between Altman and Amodeli, and the recent feud between the two had just added fuel to the fire. Sarvam AI unveils 30B and 105B foundational models

Bengaluru-based AI startup Sarvam AI has introduced two new large language models- Sarvam-30B and Sarvam-105 B. The announcement was made at the India AI Impact Summit 2026, where the company showcased its AI ambitions, including the Kaze smartglasses. Interestingly, this is the first time any Indian startup has created large-scale AI models that can compete with global systems in different tasks like reasoning, coding and data analysis. tinyurl.com/bp7tyhnm

Why India needs Sovereign AI models

BharatGen CEO Rishi Bal explains in an exclusive interview

—By **Vyom Ramani**

Operating as a government-funded non-profit, BharatGen isn't just building another chatbot; it is constructing a sovereign foundation designed to ensure that India's digital future cannot be "turned off" by shifting global policies or foreign dependencies.

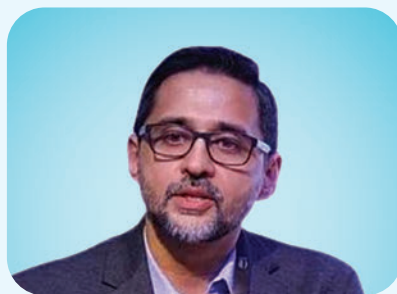

"BharatGen is India's sovereign foundation model builder, but it's also a lot more. BharatGen's mission is to raise the overall AI ecosystem in India. And that's part of the reason that we constituted this company as a non-profit. BharatGen is entirely govt funded."

Engineering the "Indianness" of Param 2 17B

The crown jewel of this effort is the Param 2 17B model, an architecture built "from first byte to final model" entirely within India. Unlike many global models that treat Indian data as a 2% footnote, Param 2 is infused with up to 50% Indian-centric data.

BharatGen CEO Rishi Bal is quick to distinguish this from simply fine-tuning an existing model; this is a ground-up engineering feat designed to handle the linguistic nuances of 22 different languages.

To navigate the country's diversity without dominant languages like Hindi "washing out" dialects like Tulu or

Marathi, BharatGen utilizes a Mixture of Experts (MoE) architecture. This system mimics the human brain by activating only the specific "neurons" needed for a task, which Bal notes is essential for making AI cost-effective and sustainable in a price-sensitive market.

By avoiding "dense" models where every neuron fires for every question, they reduce the immense compute

costs typically associated with frontier AI, claims BharatGen.

"Our 17B model is inherently a lot more Indian. So we use somewhere between 25 and 50 percent of Indian source data or Indian related data compared to some of the large language models trained abroad, which we estimate between two and five percent. In India, you have to be thinking about cost from day one. And so that MOE architecture gives us the benefit of both superior performance and then also lower cost."

From radio waves to thinking models

Solving the "data paucity" of Indian languages required BharatGen to go beyond the surface of the internet. The team has launched a massive ground-level operation, partnering with local radio stations to capture authentic accents and digitizing ancient manuscripts with advanced OCR techniques. This "Bharat Data Saga" ensures that the models are trained on authentic human interactions rather than falling for low-quality synthetic data that lacks cultural context. tinyurl.com/25u4j2r4
