

Motorola Signature

A flagship that focuses on what matters

Motorola has finally entered the mainstream flagship space in India with a brand-new smartphone called Motorola Signature. Priced starting at Rs 59,999, this isn't just another addition to one of the company's lineups; it's the start of a whole new series aimed at filling a gap in Motorola's premium portfolio that neither the foldable Razer line nor the value-focused Edge series quite addressed.

In a recent conversation with Digit, Shivam Ranjan, Head of Marketing, APAC at Motorola, said that Signature offers a 'truly signature experience. It's beyond premium. It focuses on creating the perfect fusion of design, innovative technology, and lifestyle experiences.'

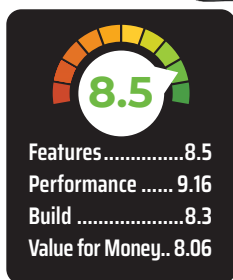

On paper, the phone looks very promising, featuring a Sony LYTIA 828 main camera, the Snapdragon 8 Gen 5 processor, a 6.8-inch AMOLED display with up to 165Hz refresh rate and 6200 nits peak brightness, and several other flagship-level features. Notably, it is the second phone in India to ship with the Snapdragon 8 Gen 5 chipset.

This review takes a closer look at how the Motorola Signature performs across design, display, performance, cameras, and battery life to see if it lives up to its flagship ambitions.

DESIGN AND BUILD

First, let's talk about the design. The Motorola Signature comes in two colour options, and I got the Pantone Carbon variant for the review. The first thing you'll notice when you pick it up is just how thin and light it is. At just 6.99mm, it feels sleek the moment you hold it, and at around 186 grams, it's comfortably light for a phone with such a large

₹59,999

display. It's easy to use one-handed and doesn't feel tiring during long sessions.

The phone features a linen-inspired texture on the back, and it gives a classy edge to the phone without trying too hard. It looks premium but understated, which is a good balance. The best part is that it doesn't pick up fingerprints at all, so I didn't have to keep wiping it down.

Another nice touch is the camera design. Instead of a separate, bulky camera island, the back material curves upward to meet the module. This creates a smooth, seamless look that feels very natural in the hand and avoids that awkward step you usually see on most phones. It also means the phone will not wobble as much when you place it flat on a table.

In terms of build, Motorola has gone with an aluminium frame and Gorilla Glass Victus 2 on the front. The phone also comes with IP68 and IP69 ratings,

along with MIL-STD-810H certification, so it's well protected against dust, water, and everyday accidents. So, the Signature focuses more on comfort, clean design, and durability rather than flashy styling.

DISPLAY

Let's talk about the display now. The Motorola Signature phone features a 6.8-inch AMOLED LTPO quad-curved display with 1.5K resolution, up to 165Hz refresh rate, a claimed peak brightness of 6200 nits, and Dolby Vision support.

I tested the display using Calman and the SpectraCal C6 Colourimeter, which showed that it is tuned for 100% DCI-P3 gamut coverage. While the colour accuracy is on point, it is not at par with the current flagships. The display recorded an average DeltaE of 2.1, which is just below the level where most people would clearly notice a colour difference at a glance.

To the average viewer, the colours will look essentially the same; however, a trained eye will still be able to make out that cooler tones are boosted. During a lux meter test, the display reached 2450 nits peak brightness. While this is way lower than the claimed brightness of 6200 nits, it is still enough to easily see the screen even in bright sunlight.

Well, in everyday use, the display feels bright, vibrant, and highly responsive, making everything from watching videos to scrolling through apps a smooth and enjoyable experience.

So, while the Motorola Signature's display might not top the charts for absolute technical perfection, it remains a high-performance panel that will satisfy almost any user.

PERFORMANCE

The Motorola Signature is powered by the Qualcomm Snapdragon 8 Gen 5, paired with up to 16GB LPDDR5X RAM and up to 1TB UFS 4.1 storage. Signature is the second phone after the OnePlus 15R to use this chipset, which already gives it an edge on paper.
