

Moto Razr Fold to launch in India soon

Motorola has showcased its first book-style foldable phone at MWC 2026. While the company has been making flip-style foldables, Moto Razr for a while now, this is its first attempt at a proper foldable device. The phone was first showcased at the CES 2026 in January and looks ready for a commercial launch. While Motorola has not officially revealed it, we hear that the phone will definitely be launched in India and probably very soon.

The Moto Razr will directly rival Samsung's Galaxy Z Fold and Vivo's X Fold which have been the go-to foldable devices for anyone in the market for that experience. I briefly got a chance to experience the Moto Razr Fold at the MWC 2026 and while the overall experience looks more or less the same, the hardware looks promising.

It has a very familiar design with a rugged back panel and its textured finish. The overall form factor and feel of the phone is also the same as most other foldable devices. It is 4.6mm thin when unfolded and 9.9mm thin when folded. It also weighs 244 grams which is more than the Samsung Galaxy Z Fold 7 and Vivo X Fold 5. However, the in-hand feel of the phone is good and it doesn't feel that heavy.

The phone has a solid camera system, identical to the Motorola's flagship Signature phone. This means you get three 50-megapixel cameras at the back with really good telephoto capabilities. I captured a few photos in slightly challenging light conditions and they came out well.

Bose is offering the speaker audio support and there is also stylus inputs unlike Samsung's foldable. The phone is powered by Snapdragon 8 Gen 5 chipset with 16GB RAM and up to 1TB storage. So while you can expect good performance, this is not the best chipset available in the market. Samsung Galaxy Z Fold 8, which will launch later this year, is expected to get a Snapdragon 8 Elite Gen 5 chipset which is more powerful and power efficient.

Xiaomi brought a supercar to MWC and it looks really cool

Xiaomi has just changed the game. It has done what even Apple failed to. You may know Xiaomi has one of the biggest phone companies in the world. You may know it for its other electronics. But, it has just made a supercar. Yes, that's right. The biggest attraction at this year's Mobile World Congress or MWC is not a tech innovation but the Xiaomi Vision Gran Turismo concept supercar which looks really cool and straight out of a sci-fi movie.

This makes Xiaomi the first Chinese automaker to participate in the iconic racing game's concept car program in its 28-year history. Historically, legacy automakers like Mercedes-Benz, Porsche, Ferrari and BMW have been part of this program.

It also shows how serious Xiaomi is about its automobile business after making a serious pivot only a couple of years ago. While this might still be a concept car and is unlikely to be commercially available,

it's a timely reminder of what Xiaomi is capable of pulling off in this space.

Xiaomi has shared limited information about the car

as well. From what we know, it sits on company's 900V Silicon Carbide (SiC) platform and features a radical low-slung design with scissor doors. There is a massive carbon fiber rear wing and center-lock wheels hiding carbon-ceramic brakes.

It is nothing like a traditional car. The regular seats are gone. There is a redesigned cockpit with a butterfly-shaped steering wheel, a panoramic display screen and what Xiaomi calls a "cocoon-shaped sofa" for the driver's seat.

The car is designed to go fast. So there are multiple front air-channel intakes, a shark-fin roofline structure, T-shaped headlights and an exaggerated rear diffuser with extensive ducting.
