Every engineer will have 100 AI agents: Jensen Huang on future of work

There are many ways to measure the productivity of an engineer that earns \$500,000 or ₹2.3 crore per year. NVIDIA's Jensen Huang, in his inimitable style and theatrical bluntness, has proposed a new one – token burn.

"That \$500,000 engineer at the end of the year, I'm going to ask him, how much did you spend in tokens?" The NVIDIA CEO was quoted while speaking on the All-In Pod on the final day of GTC 2026. "If that \$500,000 engineer did not consume at least \$250,000 worth of tokens, I am going to be deeply alarmed," emphasised Huang.

If you think about the implication of what Huang is suggesting, it effectively inverts decades of enterprise thinking. Efficiency, in the classical sense, is all but dead in the age of AI. Under-utilisation of resources – not excess – is the bigger sin. tinyurl.com/i1272rd

What is tokenmaxxing: A game employees are playing to show how much AI they use

Remember when the most competitive thing at work was who could reply to emails fastest? Those were simpler times. Meet tokenmaxxing, the new workplace sport where employees compete to burn through as many AI tokens as possible. Tokens are the small units of text that AI models process every time you fire off a prompt. They cost money, and now, apparently, they're a career move. tinyurl.com/s81hs13

Elon Musk plans to build his own computer chips

Elon Musk has announced Terafab, a giant chip factory in Texas where Tesla and SpaceX will design and manufacture their own AI chips. Frustrated by Nvidia dependency and global chip shortages, Musk wants full control over production

for self-driving cars, Optimus robots, and even space-based AI satellites. The vision is enormous – he's talking "galactic civilisation" – but so are the challenges. Building chip factories costs billions and takes years. tinyurl.com/dc73hs3
