

Dell Pro 14 Premium PA14250

A business ultrabook that earns its price tag

The Dell Pro 14 Premium PA14250 is one of those laptops that makes

sense the moment you stop judging it as “just another 14-inch Windows machine” and start looking at what it’s actually trying to be, which is a thin, premium, corporate-friendly ultrabook (if we’re still using that term) that leans hard into three things at once, namely portability, battery life, and a modern AI-ready platform. In the particular configuration given to us, Dell has gone with Intel’s Core Ultra 7 268V on the Lunar Lake-MX platform, paired it with 32GB of LPDDR5X memory, a fast-enough 512GB Samsung NVMe SSD, Intel’s latest Wi-Fi 7 BE201, and an OLED panel that is far more ambitious than the average business laptop display.

What makes the PA14250 particularly interesting is that Intel’s Lunar Lake approach changes the tone of the performance discussion. Instead of chasing the highest multi-core score at any cost, the platform tries to deliver strong single-core responsiveness, respectable multi-core throughput, and better efficiency under real workloads. Business laptops spend a lot of their time off the charger, and because premium thin-and-lights cannot rely on brute cooling to cover up power-hungry silicon, it helps if you have an efficient processor.

BUILD QUALITY

The PA14250 communicates “premium” in a way that suits a business machine:

₹2,40,000

not through flamboyant styling, but through restraint and materials that feel chosen for utility as much as aesthetics. The recycled magnesium chassis is a good foundation for a 14-inch ultrabook because it can deliver stiffness without pushing

weight upward, and in this category stiffness is not just about durability. It’s about the confidence to use the laptop one-handed, to type energetically, and to throw it into a bag without feeling like the lid needs kid-glove treatment.

At 1.3kg, portability is a genuine strength rather than a spec-sheet boast. This is a weight that makes a difference in routine, especially for commuters, frequent travellers, or anyone moving between desks and meeting rooms. It also means the laptop can comfortably coexist with the other things work bags accumulate: chargers, notebooks, a mouse, dongles (even if fewer are needed here), and the inevitable “just in case” accessories.

Rather than going all-in on USB-C minimalism, Dell includes HDMI and a USB-A port. That choice implies a laptop designed to reduce friction for real work setups: meeting rooms, existing peripherals, and environments where “just use a dongle” is not the default behaviour.

Overall, the PA14250’s build quality aligns with what premium business laptops should aim for: light, stiff, practical, and not visually exhausting.

PERFORMANCE

Performance on a laptop like the PA14250 should be read through two lenses. The first is “how fast does it feel in the work that actually happens”, the second is “how consistent is that speed under sustained load without turning the machine into a noisy, hot compromise”. Benchmarks can

cover the first lens well and partially cover the second, but the real judgement comes from how the numbers align with the thermal and power characteristics of the chassis.

The PA14250’s results suggest a well-balanced platform. CPU benchmarks indicate strong single-core speed and solid multi-core capability for an ultrabook class device. The integrated Arc 140V GPU produces unusually capable results for a business laptop, supporting light creative workloads and casual gaming without the need for a discrete GPU. Storage performance is comfortably modern, with strong sequential throughput and reasonable random performance that should translate to snappy app behaviour. Battery life is a standout, especially for an OLED configuration.

CPU performance

Cinebench R23 posts 1,926 in single-core and 10,082 in multi-core. Similarly, Cinebench 2024, often a better reflection of modern rendering pipelines, returns 122 single-core and
