

Vivo V70

Built for photography, balanced for daily use

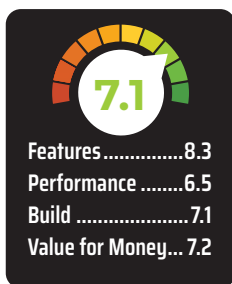

The Vivo V-series has always been known for its camera and design. Every generation takes the design quotient up a notch and features camera upgrades. With the Vivo V70, that focus hasn't changed. What has changed, though, is how balanced the phone feels overall. After using the Vivo V70 as my primary device for two weeks, it's clear that this is no longer just a 'camera phone' with compromises around it. It feels far more rounded than previous V-series devices. During my time with the Vivo V70, I also spent time comparing it with another phone offering almost identical hardware on paper, just to understand where Vivo's tuning makes a difference. And that's exactly what this review focuses on: how the Vivo V70 performs when you actually live with it, beyond the spec sheet. Let's dive in.

DESIGN AND FEATURES

The Vivo V70 looks clean and understated, but there's enough personality here to keep it from feeling boring. I used the Passion Red colour variant, and depending on how light hits the glass back, it subtly shifts shades, which looks genuinely premium. The phone uses a glass back and comes in at just 7.59mm thickness, which is impressive considering the massive battery inside.

At 194 grams, it's not the lightest phone around, but the weight distribution is done well, so it never feels top-heavy or uncomfortable during long usage sessions. That said, the matte glass back does make the phone slippery, so using the included case

₹45,990

is something I'd strongly recommend.

Durability is a strong point here. The Vivo V70 comes with IP68 and IP69 ratings, which means it can handle water, dust, and even high-pressure water exposure. You also get a 3D ultrasonic fingerprint scanner, which is faster and more reliable than optical scanners, especially when your fingers are slightly wet.

One small annoyance is that the phone wobbles a bit when placed flat on a table due to the camera bump, but again, you can fix it by the phone cover.

DISPLAY

The Vivo V70 comes with a 6.59-inch 1.5K AMOLED display with a 120Hz refresh rate, and while that might not sound headline-grabbing on paper, the actual tuning here is very well done. The panel uses a P3 wide colour gamut,

has a pixel density of 459 PPI, and Vivo claims a local peak brightness of up to 5,000 nits.

To understand how good this display actually is, I ran it through our Digit Lab tests. In the Calman colour accuracy test, the Vivo V70 recorded an average Delta E of 1.1, which is already very good and indicates accurate colour reproduction. In the colour gamut test, the phone covered 99.1 % of the colour space, which explains why content looks rich without appearing oversaturated.

In the brightness test, the Vivo V70 peaked at around 3,160 nits, and in real-world usage, outdoor visibility is excellent. Even under direct sunlight, the display remains readable and comfortable to use.

However, what really matters is how the screen performs in daily usage. With the display set to natural colour mode, the Vivo produces vibrant yet controlled colours, making it great for watching content.

I watched Dark on Netflix, and shadow details, contrast, and colour consistency were handled really well. This is one of those displays that quietly impresses the more you use it, especially for media consumption.

PERFORMANCE

The Vivo V70 is powered by the Snapdragon 7 Gen 4 chipset, paired with 8 GB LPDDR5X RAM and 256 GB UFS 4.1 storage. In daily usage, the phone feels smooth and responsive. App launches are quick, multitasking is reliable, and I didn't face any noticeable lag or stutter during regular usage.

I also ran a full set of benchmarks to see how it performs. On Antutu, the Vivo V70 scored around 1.43 million. In Geekbench, it recorded 1,078 in the single-core and 2,901 in the multi-core. In the CPU throttling test, the phone maintained around 93% stability, which shows that sustained performance is handled well. In the 3DMark Wild Life Extreme benchmark, the device
