

Gabit smart ring

Good habits take time, not a timepiece

G. S. Vasan | editor@digit.in

I own a smartwatch, and although it comes with all the usual health and activity tracking features, I wear it only when I am out and about. That means for a large part of the time when I am at home, I do not wear it and therefore do not benefit from those features.

So when a new smart ring from a domestic brand called Gabit tried to entice my finger, I was no doubt curious. Priced around Rs 13,775, I wanted to see whether a smart ring can be a better wearable for me than a smartwatch. The company sent me a review unit and here's my experience after dailying it for several weeks.

Design in daily use

The Gabit ring follows the typical design language of most smart rings today. It uses a titanium outer shell with a resin interior that sits against the skin. Titanium keeps the ring light and durable, while the resin layer prevents skin irritation during long wear.

The black ring looks bold and noticeable on my right index finger. You can customise the colour and size while ordering the ring online through the Gabit website.

You don't have to worry whether the ring fits you well, as the company sends a sizing kit with plastic rings first. If you wear the sample ring for a day at least, you will know how that size suits the changing finger size throughout the day based on temperature, hydration, activity, etc.

I got a size 9 ring. The standard ring dimensions on the Gabit website are around 8mm wide, about 2.7mm thick and approx 4g in weight. It is light, and those dimensions are normal for a smart ring, but it is still wider than a traditional ring. It doesn't bother me mostly, but I do notice its presence while washing my face. Bystanders and my dog also notice the new accessory on my hand. Sometimes the sensors inside glow up, which also gives away its smart ring identity.

Inside the ring are three small sensor nodes. These bumps press the sensors against the skin. The idea is to keep the optical sensors flush with the finger to reduce light leakage and improve data accuracy.

Even with those minor sensor protrusions, the ring is comfortable to wear. I wore the ring during sleep, workouts, and daily tasks without discomfort.

In daily wear, it is obvious that the ring will hit or rub against different surfaces. In my case, having a dog also meant it occasionally playfully bit the ring. Titanium is strong, and the matte black coating did not get scratched or damaged, but after a few weeks of use, I noticed that in one area, the coating had lost some of its sheen. Lighter colours may not have this problem, and you could buy the silicone protective case from the brand, which is sold separately.

Consistent tracking and crowded app UI
