

portion of the finger where a ring typically sits, is known to have good blood perfusion. Dense capillary networks run close to the skin here. Sensors placed on the inner side of the ring, facing the palm side of the finger, can therefore detect changes in blood volume more effectively. Compared with the wrist, the skin in this area is thinner, and the vessels are closer to the surface, which can help improve the accuracy of optical readings. I compared the health measurements from this ring with a smart watch tied to my wrist.

The Gabit ring uses three main sensors:

- Optical PPG sensor for heart rate and blood oxygen
- 3-axis accelerometer for movement tracking
- Skin temperature sensor

Starting with step counting, it measures precisely or close to what my Samsung Galaxy Watch 4 was showing. The calorie count varied by a few kcals. Not bad.

In daily use, heart rate readings were consistent and sometimes deviated by a few beats per minute (BPM) compared to my Galaxy watch.

Stress monitoring also provided comparable results to my watch.

The ring also records skin temperature data, and I have largely consistent data. The built-in PEP assistant tells me this means my body is effectively managing its temperature. In case there

are random or irregular fluctuations, that could mean illness, the body is under stress, or hormonal cycles. But the app doesn't automatically predict or give insights. You have to manually use the PEP assistant, and like most AI tools, this can make mistakes. So, use your due diligence.

Sleep monitoring is one of the main reasons people buy smart rings. A ring is lighter than a watch and less likely to disturb sleep.

The app shows:

- total sleep duration
- sleep debt
- consistency
- sleep stages like wake after sleep onset (WASO), deep sleep, REM sleep and light sleep
- resting heart rate
- sleep score, a grade like Poor, Good, and Excellent.

Sleep duration usually matched my actual bedtime and wake-up time. But the awake time could be slightly off.

Besides this, you can also test VO2 Max, log the food you consume to calculate calorie intake, compare it with calorie deficit, and get your recovery score on the Gabit app homescreen. By the way, the Gabit ring doesn't support SpO2 or blood oxygen reading.

You can set the app appearance to day (light) or night (dark) mode, create tribes with fellow Gabit users and connect with these accountability partners of yours, set goals, and shop Gabit ring

accessories, other Gabit and Nack (a Gabit company) nutrition products.

The Gabit ring relies heavily on its companion app. And there is a lot of information densely presented. Besides that, those ads and tabs also fight for your attention. For some, this interface can seem crowded and overwhelming.

And of course, a limitation by design is that you need to use the phone app to manually run some tests, and you will need a stable internet connection to sync all the logged data and analysis properly.

Reliable battery life

The Gabit ring uses a very small lithium-ion battery between 14.5mAh and 21.5mAh, depending on size. And the company claims 7 to 10 days of battery life. In my testing, with regular syncing and workouts, I was getting by the weekdays.

I didn't have to charge it often like some smartwatches. And when the Gabit app gives you a low battery alert via its homescreen or a phone notification, you can place the ring in the bundled case. The case can be topped up with a USB-C charger and takes about 2 hours to fully fill the tank. A bit slow, but I don't mind, as even if the ring is without any charge, it is still wearable as a ring, you know.

The battery life is close to what many of the leading smart rings offer, but there are outliers like Boat Valour Ring with up to 15 days of claimed runtime.

Should you buy a Gabit ring in 2026?

If you are a regular user who wants a lightweight, continuous health tracker under Rs 15,000, the Gabit ring is worth considering. It makes most sense for people who want continuous health tracking but do not enjoy wearing a smartwatch. **d**
