

HyperX SoloCast 2

Better than a headset mic, but what else?

Divyanshi Sharma | editor@digit.in

As someone who's a fan of story-mode titles, I have never really felt the need of a microphone. Unlike multiplayer games, story-mode titles don't really require communication and what really matters is immersion. Of course, it is only during an occasional match with friends that I actually feel the need to plug in a mic. That, or during a very random karaoke session with my sister where we end up singing and recording just for laughs. Then there are moments when I need to record a quick voiceover for an Instagram reel, and all of a sudden, audio quality suddenly becomes far more important than I would like to admit.

Now, for the longest time, I relied on a basic headset mic. It worked, but it never sounded particularly clean or full. Since I do not play competitive titles every day, spending a large amount on a professional-grade mic never made sense to me. I wanted something affordable, easy to use, and reliable. And when I got the chance to review the HyperX SoloCast 2, it just ticked a lot of boxes. It

is simple to install, comes with a physical mute button, and most importantly, it sits comfortably under ₹5,000.

At the time of writing, it is retailing for ₹4,499 on Amazon, which makes it a very approachable upgrade over a standard headset mic. So, should you upgrade your gaming setup with this microphone?

Installation and design

Setting up the HyperX SoloCast 2 is quite simple. I just had to plug the USB-C cable into my PC, wait a few seconds, and it was ready to go. I didn't have to deal with any driver drama, a confusing setup wizard, or even a mandatory software installation just to get started.

Coming to the design, the SoloCast 2 mic features a clean cylindrical body finished in matte black, which gives it a minimal and modern look on the desk. It does not try too hard to stand out, yet it still feels premium for its price. If you are familiar with HyperX products, you will instantly recognise the brand's signature red LED indicator. The light

glows to show that the mic is active, making it very clear when you are being heard. Apart from adding a subtle pop of colour to an otherwise stealthy setup, it is genuinely useful, especially for first-time users who just want a quick visual confirmation that the mic is on and working.

Talking about the build quality, the mic feels sturdy in hand and despite its compact size, it does not feel cheap. One of my favourite aspects is the built-in stand. It is integrated into the body and allows you to tilt the mic towards your face. For budget-conscious users, this matters. You do not have to immediately invest in a boom arm or any other stand to make the mic usable.

The base is stable enough for desk use, and it saves both money and space. Yes, the height is slightly low for ideal positioning, but for casual gaming and quick recordings, the included stand does the job well.

Software and features

The SoloCast 2 works with HyperX Ngenuity software, which is where
