

Cyberpunk 2077 to Forza Horizon 5 and more. Now, this is a machine built to be pushed. And after doing exactly that, I wasn't disappointed with the results.

At 4K resolution with graphic settings maxed out, games like Cyberpunk 2077, Doom: The Dark Ages were easily playable and getting stable 100+ FPS. The Nvidia DLSS 4 played a major role in boosting the frame rates here and ensuring a hassle-free experience. When I switched the resolution to 1440p, the laptop hit a sweet spot, offering 150+ frame rates without compromising too much on visual quality. And taking the resolution down to 1080p gave the absolute best experience.

So, if you're a competitive gamer, there is all the performance you need here. Other demanding titles like Dragon Age: The Veilguard, Silent Hill f, and Forza Horizon 5 also ran smoothly across different settings.

This performance is backed by the benchmark scores. In tests like Cinebench, Geekbench, and PCMark, the laptop holds its ground quite well.

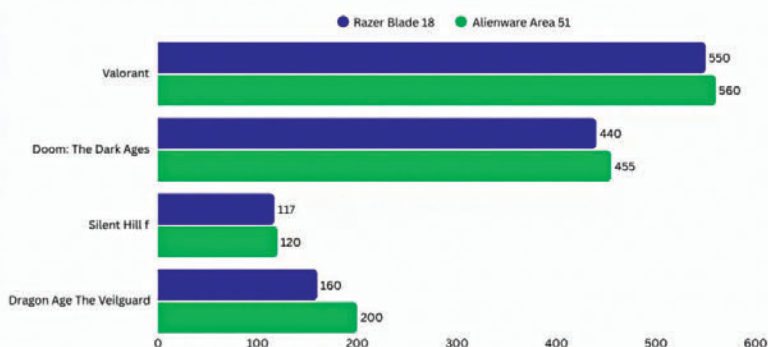

It is on par with, and in some cases, even exceeds that of the Alienware 18 Area 51, which costs over Rs 5 lakh.

The performance here is not just about brute force. It is about stability, consistency, and smart workload handling. And that is exactly what makes the Razer Blade 18 feel as fast and dependable as it does in everyday use.

BATTERY LIFE AND THERMALS

Let's now talk about the battery life. Gaming laptops, especially those that come with such immense power, aren't really known for their battery lives. And that is fine since the target audience here usually keeps their laptops plugged in at all times. In the case of the Razer Blade 18, the laptop lasted a little over an hour while gaming with full brightness and keyboard lighting enabled. One thing to note is how the performance here remained stable throughout, which is a good sign. I played Forza Horizon 5 on battery and was getting a stable and smooth experience.

AVERAGE GAMING FPS

When I used the laptop for regular office work at 50 per cent brightness, and RGB lighting turned off, the battery lasted around 5 hours. Again, considering the size of this machine, this is a respectable result.

Coming to thermals, the laptop does get hot, but never too much to handle. You will feel the keyboard keys (especially the IJKL area) get warm after intense gaming sessions, but that is normal. Surface temps hovered around 39 degrees Celcius while the CPU temps touched a whopping 120 degrees Celcius during benchmark tests. Now, considering how slim (relatively) the laptop is, these temps are justified.

VERDICT

The Razer Blade 18 hasn't been launched for the Indian market yet. In the US, the unit that reached Digit Test Labs for review costs 4,899 USD, which is roughly Rs 4,75,000.

If the laptop does come to India, should you buy it? I would say yes.

The Razer Blade 18 is a powerful gaming laptop that delivers where it matters the most to its targeted cus-

tomers. It offers strong performance, a great display, and a surprisingly manageable design for its size. Yes, there are some minor flaws, but those are usually expected in massive gaming laptops.

So, if you are someone who wants a desktop-level experience in a laptop form factor and are willing to accept these trade-offs, the Razer Blade 18 is worth a serious look. That is, if it officially comes to India. Fingers crossed!
