

■ **ANDROID UPDATE**

Android 17's beta brings built-in controller remapping, here's what it does

Google has introduced controller remapping in Android 17 Beta, a highly requested feature aimed at improving the gaming experience. The update allows users to customise controller inputs at a system level, meaning changes apply across all games without needing to reconfigure controls individually. It supports both wired and Bluetooth controllers, enabling remapping of

face buttons, triggers, thumbstick clicks, and even directional inputs like swapping the D-pad with analog sticks. Users can access the feature

through Settings under the new Game Controller menu, depending on whether the controller is wired or wireless. The addition comes after consistent user feedback and is expected to streamline gameplay for mobile gamers. However, the feature is currently limited to Android 17 Beta 2 and later, and requires an eligible device enrolled in the beta program. tinyurl.com/8hgtj4

Apple App Store now supports 11 new languages

Apple has expanded their App Store with support for 11 brand new languages, including 10 that are widely spoken in India such as Hindi, Tamil,

Telugu, Marathi, and more, bringing the new total up to 50 different supported languages. The update allows developers to localise app metadata like names, descriptions, and screenshots, helping apps reach broader regional audiences. Apple has also introduced localised App Store badges and confirmed that these additions aim to improve discoverability and user engagement across diverse linguistic markets. tinyurl.com/8pas276

WhatsApp to soon introduce paid channels for content

Meta is testing a new monetisation feature for WhatsApp that enables creators to earn through paid channel subscriptions. Spotted

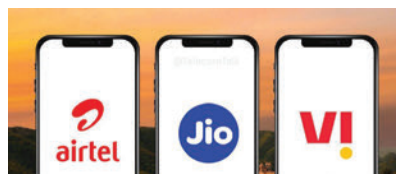

in beta, it allows exclusive content behind a paywall while keeping free updates available. Creators can set pricing and display subscriber counts for transparency. Users may also see filters separating free and premium posts. The feature will follow existing platform policies and is expected to roll out in the coming months, though no official date has been confirmed yet.

■ **TELECOM UPDATE**

Jio, Airtel and Vi may add cheaper recharge

Meta is reportedly testing a new monetisation feature for WhatsApp that would allow creators to earn through paid channel subscriptions. Spotted in beta, the feature enables channel owners to offer exclusive content behind a paywall while continuing to share free updates. Creators may also set their

own subscription pricing and display paid subscriber counts alongside total followers for transparency. Users can

still access channels for free, with premium content clearly separated. The platform is expected to enforce existing policies for both free and paid content. Still under development with no confirmed release date, the feature signals WhatsApp's push toward creator-driven monetisation. tinyurl.com/9jow3fn
