India leads world in AI skill penetration and AI nervousness

The Stanford University AI Index 2026 is a dense 423-page report tracking the rapid evolution of artificial intelligence globally, and India features prominently. While the country shows strong momentum across several areas, the data also reveals structural gaps that could shape its position in the AI race.

One of India's biggest strengths lies in research output. In 2024, India contributed 7.6% of global AI publications in computer science, placing it third worldwide behind China (17.8%) and Europe (11.1%).

India holds just 0.4% of global AI patents, amounting to a little over 500 filings. This highlights a gap between research and commercialisation. Nearly 80% of India's patent work overlaps with the US and China, suggesting that Indian innovation is in similar domains rather than exploring entirely new frontiers. tinyurl.com/8ujc290s

Why are RAM prices falling: Is it the best time to upgrade

RAM prices haven't suddenly become reasonable, they've just stopped spiralling quite as fast. Recent dips come from a mix of events rather than any real shift in supply fundamentals. Google's TurboQuant, a memory compression method targeting AI inference, triggered a sharp but arguably overblown market reaction. Stocks like Micron fell nearly 30% in two weeks, despite strong financials. Analysts stress it doesn't reduce long-term DRAM demand since it doesn't affect training workloads. tinyurl.com/76yshx

Intel will make Elon Musk's Terafab chips: Here's why

Elon Musk has partnered with Intel to manufacture chips for Terafab, his ambitious AI semiconductor project in Texas. The goal is an enormous one terawatt of annual

compute. While details remain unclear, the deal gives Intel a crucial role in Musk's AI ecosystem, offering a potential boost as it competes with Nvidia. tinyurl.com/8dhg17c
