

Samsung Galaxy A37

Is the reliable experience worth the premium

The timing of the Samsung Galaxy A37 launch couldn't have been more peculiar.

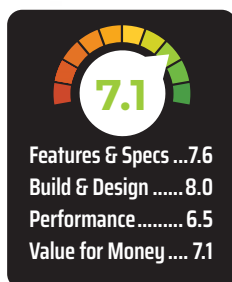

For all we know, the Galaxy A3x devices have usually launched in the ballpark of around Rs 35,000. All of a sudden, in 2026, the top variant of the new A37 is priced at over Rs 50,000. You read that right. The Galaxy A37 5G price in India starts at Rs 41,999 for the base 8GB RAM + 128GB storage, while the 8GB + 256GB option costs Rs 47,499. The top-end 12GB RAM + 256GB storage is priced in India at Rs 52,999.

If you have a budget of around Rs 40,000 to Rs 50,000, and if you are planning to get the Galaxy A37, what exactly makes it special? There are quite a lot of things that I like about this phone, and some I don't. Here's my full review.

THE IN-HAND FEEL

The in-hand feel is quite good. I am quite impressed with the phone's ergonomics and how it looks.

The design unification strategy is seen in full swing here. The Galaxy A37 got the looks of the flagship S26 series, but you can get this one at a relatively affordable price. I absolutely love the lavender purple finish here. I think the black colour is also quite cool. Unlike the flagship S series, which has a matte rear panel, the Galaxy A37 features a mirror-like glossy rear finish. The purple version, since it's a light colour, does a very good job of hiding the smudges. I am not so sure about the black colour, though. You'll have to slap a case on it. The button placement is just where I

want it, and they have good tactile feedback. The optical fingerprint sensor has the perfect placement. Of course, I would've loved it if it could be placed slightly above, as Samsung places its ultrasonic fingerprint readers in the S series phones. But this still works.

And, partly the reason why my experience is positive with this phone also lies in the fact that I am coming from the Galaxy A35. That changes it all. Because, while an A36 user may not be able to see a big difference here, folks who have older models will definitely appreciate the attention to detail. For instance, something I also mentioned in my first impressions (second shameless plug), the Galaxy A37 is quite slim, which totally adds to how the phone

sits in the hand. The edges around the corners are soft. The glass back (protected by Gorilla Glass Victus+) adds to the premiumness. I also didn't miss the metal rails here. Of course, that would've been a plus, but the polycarbonate frame is what I feel also helps in keeping the weight in check. At the same time, it feels dense, so definitely a good quality frame here.

Overall, design-wise, there are no complaints. The Galaxy A37 looks good, the choice of materials is great, and the button placement works. The dust and water resistance is also bumped to IP68.

Only if the chin at the bottom bezel were also uniform as the rest of the front profile, that would've sealed the deal.

THE DISPLAY

One area where Samsung always excels is in the display and the overall multimedia experience. On the Galaxy A37, we are looking at this gorgeous 6.7-inch Full HD+ panel with a 120Hz refresh rate and Gorilla Glass Victus+ protection. And this is the kind of screen that doesn't brag about having a crazy 5,000 nits brightness or some other fancy tech, which only sounds good in name. Instead, it simply delivers.

Is it sharp? Yes. Does it offer good colour and contrast? Well, the natural and vivid screen modes are calibrated for 100 per cent sRGB and DCI-P3 colour spaces, respectively. My point is, colours look fantastic on this panel, and by the way, you get all the extra goodies such as eye comfort and vision booster.

Also, when it comes to the brightness, I am not going to talk about the peak numbers. We all know, brands can always brag about having 4,000 nits, 5,000 nits, 6,000 nits and so on as peak brightness, but that's only for a very small window of the screen or even just a pixel. In fact, I don't even know what the peak brightness of the Galaxy A37 is or if Samsung even tells us that. What I know is that I tested the phone's display
