

in the Digit Test Labs, and it reached a solid 1,937 nits of HDR brightness. Yes, there's support for HDR10+ as well, just in case you thought otherwise.

Basically, the Galaxy A37 offers a brilliant display experience. You'll love it if you enjoy watching content on your phone. For that matter, the stereo speakers are also very solid and get quite loud without sounding shrill.

PERFORMANCE

Without beating around the bush, the Galaxy A37 performs reasonably well in day to day usage. But you also need to ask yourselves, what's the definition of a solid performance? Because, let's clear this out, this is a mass market device. While you do get devices in this price segment that offer stronger hardware, the question remains: which phone is the end consumer actually buying?

In the case of the Galaxy A37, it is powered by the 4nm Exynos 1480 chip, paired with up to 12GB LPDDR5X RAM and 256GB UFS 3.1 storage. I would've loved to see UFS 4.0 storage here, but UFS 3.1 is also good enough, and with the LPDDR5X RAM combined, the speed and responsiveness, especially coming from the A35 or even the A36, is pretty noticeable. In my personal experience, I've never experienced an A3x phone being this fast and responsive.

In day-to-day use, app opening times, along with app switching, are fast. Animations and transitions are fluid and snappy. Basically, you just feel the smoothness whenever you're interacting with the screen, hitting a menu, scrolling in the browser and so on.

There's One UI 8.5 atop Android 16 here, with a promise of 6 years of software updates. It's a familiar user experience for me, especially when my main phone is a Galaxy S26 Ultra. Of course, when I say a familiar user experience, it doesn't mean all the features from the S26 series are here. Think about it like this: the Galaxy A37 brings a lot of those essential features over from its flagship S26 siblings, especially when it comes to how the software looks and feels.

For instance, I use a lot of AI Select on the Galaxy S26 Ultra. For those who don't know this feature, you can imagine it as Circle to Search (which is also here, by the way), but on steroids. Or the voice transcription feature in the recorder app. You don't know how handy it becomes to record interviews and not rely on third-party apps for transcriptions. The Galaxy A37 does it for free. Then, there's the new and improved Bixby, which understands natural language. And I know, it can't match the finesse of a Gemini or ChatGPT, but it is not intended to. For on-device stuff like looking for a setting, or changing the alarm, or putting a reminder, the general stuff, Bixby now does it better and faster, by just giving a simple voice command. It's quite convenient.

The AMD Xclipse 530 GPU offers decent mid-range gaming performance. I won't call it the best in the segment; if you want that, you buy one of the Chinese gaming-focused phones. But, for its target consumer, who would mostly want their phone for casual gaming, the Galaxy A37 would suffice. In my testing, the Galaxy A37 was able to run games such as Asphalt: Legends, BGMI and Call of Duty: Mobile, at 60 fps, with minimal frame drops during long sessions. Do note that the GPU is capable of 90 fps gaming too, but that totally depends on the game updates and developer optimisation.

FINAL VERDICT

There is no getting around the fact that this is a massive price jump for an A3x device. But once you actually hold the thing, all of it starts making sense. For starters, the Galaxy A37 shares enough DNA with the S26 series that it doesn't feel like an 'affordable' alternative anymore. Also, between the IP68 rating and a display that's genuinely great for content consumption, the Galaxy A37 feels solid and premium in a way that many mid-rangers usually don't.

If raw benchmark scores are something that matters to you, you'll find faster Chinese handsets that offer more 'bang for your buck'. The Galaxy A37 is simply the reliable pick that won't give you a headache. One UI is clean, the main camera is pretty consistent, and the battery gets me through a full day.

—Aman Rashid

SPECIFICATIONS

Processor: Exynos 1480 | RAM: 12 GB LPDDR5X | Storage: 256 GB UFS 3.1 | Operating System: One UI 8.5 | Display: 6.7-inch Full HD+ | Refresh Rate: 120Hz | Brightness: 1987 nits | IP Rating: IP 68 | Camera (Rear): 50MP + 8MP + 5MP | Camera (Front): 12MP | Battery: 5,000 mAh | Charging: 45W
