

AI will create jobs we can't even imagine today

Nutanix' chief AI officer **Debo Dutta** is bullish on AI

Divyanshi Sharma | editor@digit.in

Roughly 2 years back, DeepMind co-founder Mustafa Suleyman predicted a future where AI assistants will be easily accessible to everyone. And now, Nutanix chief AI officer, Debo Dutta, also believes that agentic AI will be used in future not just by companies, but also by the general public. Now this isn't just a shot in the dark statement, Dutta says this after years of leading AI operations at Nutanix, a company that helps other businesses run large LLM models.

In an exclusive conversation with Digit, Dutta talked about a future full of AI agents and more. Here are excerpts from the conversation.

rently manual. He imagined a typical morning where, instead of checking multiple apps, users simply ask an AI assistant for a quick summary of their day, from personal priorities to cricket updates.

He added that while this may begin in urban India, the bigger impact could be in rural areas, where shared access to AI-driven healthcare and education can help bridge the development gaps.

According to him, AI's most meaningful role at scale will be in augmenting doctors and teachers, improving access and outcomes.

On India's role in the global AI race, Dutta pointed to the country's large base of engineers and professionals. He believes that India will see increased

agentic software development, along with widespread adoption of agentic AI tools, helping individuals across various different sectors automate quite a lot of their daily work.

"The real value I see is when each person can automate some of their lives with agents. Whether it is a farmer, or a shopkeeper, small businesses," he said.

On AI taking human jobs

There has been a growing concern amongst people about AI taking away human jobs. And Dutta doesn't shy away from acknowledging

that concern, but he also says that there are going to be amazing opportunities in the future as well.

He said, "In the long run, AI will create more jobs. But in the short run, people who don't upskill themselves

with AI will be at a disadvantage. Because today, AI is making people much more productive. So, my recommendation to my own team, friends, family is that please learn AI just as a tool. And you'll have jobs that we haven't imagined before."

Debo Dutta
Chief AI Officer,
Nutanix

On AI changing lives in India

Talking about how AI could change lives in India over the next few years, Dutta said people will increasingly rely on AI agents for tasks that are cur-

Nutanix and security

As we mentioned already, Nutanix helps companies run massive AI models. But how do they do that without compromising sensitive data of said companies? Dutta says, "Agents today need tools to access data. If you restrict some of those tools, you can protect the companies' data. And that's what we have done. Then of course, the agentic memory layers run on our infrastructure and the foundation of that is a secure data platform.

As our conversation drew to a close, Dutta said that the future is bright for both, big corporations and your average consumer. And a time where we all have our own 'minion' isn't all that far. **d**
