

The Enigma code

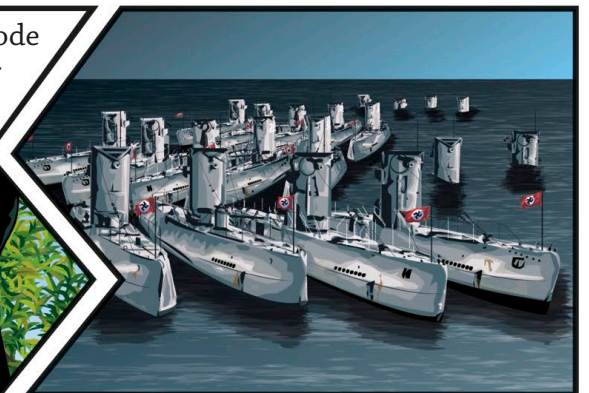

In the 1930s, Germany wanted to control other countries. In 1939, it invaded Poland. Britain and France declared war in response, and World War II began. The war was fought with new technology like tanks, radar, and the top-secret Enigma machine.

In World War II, armies fought on land, air, and sea, and moved between battles quickly. Telegraph and radio were used to send orders across huge distances.

The Germans used a machine called Enigma to encode their messages. This allowed them to surprise their enemies, and communicate with their spies.

These secret orders made it impossible to track down the deadly German submarines, called U-boats.
