Motherboard

This large circuit board holds the processor. Everything connects to it, so that different parts of the computer can communicate.

Processor

This is the “brain” of the computer. It performs most of the calculations that make the computer work.

Battery

Computers need power to work. The battery powers a laptop when it is not plugged in.

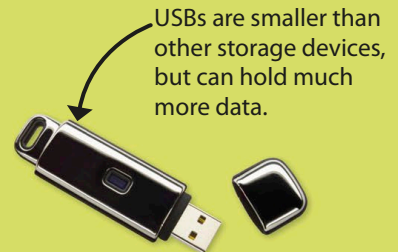

CD

A CD uses a laser to write data onto a disk. It can store much more data than a floppy disk.

DVD

DVDs have better sound and more space than CDs, so are used to store video files.

USB

Memory sticks hold more data than DVDs. They plug straight into a computer.
