

Barcode scanner

Every item in a store has a unique code of lines to identify it. These lines, or barcodes, are read by a computer that finds the item and its price in a database so you can buy it.

Vehicles

Cars use computer code to monitor their engines and make sure they run well. Code also controls things like the blinkers on the dashboard and windshield wipers.

Calculator

Calculators use code to figure out the answers to mathematical questions. They display the results immediately on the screen.

Smartboard

These giant screens use computer coded instructions to let students choose and control what information is shown. All they have to do is touch the screen.
