

What is a coder?

Coders, or programmers, are people who write the code for computer programs—a set of instructions that tell computers what to do. Many coders teach themselves how to code, others learn at school. Coders need a variety of different skills in order to build good programs.

Coders working together

Code in teams

While many coders work alone, most of them work in teams. Working in teams means programs are finished faster and with fewer errors.

Teamwork also helps coders learn new skills from others.

Logical thinking

Computers follow rules and logic when running programs. Coders need to be able to think like a computer when writing code, and build in all the steps necessary for the program to work.

Many languages

Being able to code in different computer languages is a valuable skill. It is important for programmers to keep learning new coding languages in order to create modern programs.

Creating code

A typical coder's screen is filled with code like this.

Pepper the robot

Code allows Pepper to read people's feelings.
