

Magnetism

Magnets have an invisible force field of energy around them called a magnetic field. This field can push away magnetic objects or pull them near. It may seem like magic, but it is the energy in the magnetic field that gives the magnetic objects the power to move.

Electromagnets

Electricity can make magnets and magnets can make electricity! If electricity is sent through a wire, it creates a magnetic field around it. These types of magnet are called electromagnets. They are useful as they can be turned on or off.

Electromagnetic arm

A powerful electromagnet at the end of this arm is used to separate magnetic from non-magnetic materials. Iron and steel stick to the arm when it is on and are taken to be recycled. To put them down again the magnet is turned off.
