

Magnetic objects

Objects that are attracted or repelled by magnetic fields are magnetic. Some metals, including iron, are magnetic. However, most materials, such as wood, plastic, and fabric, are not magnetic.

Magnetic Earth

Planet Earth is one giant magnet, with a magnetic field that shields us from harmful space rays. A compass works because its metal needle is attracted to the Earth's magnetic field. The marked needle always points north.

The needle of a compass points to magnetic north.
